MANUALE DELL'ARCHITETTO

ORIGAMISTA

Foreword

Nowadays origami techniques allow the realization of a lot of things, but there is still a large lacuna: no books deal with architectural structures. That's why I have written this manual.

Given the extent of the subject, I have decided to write a manual that can be periodically updated in common with other publications in the construction sector. This book incorporates my earlier manual titled "Legorigami 1" about ancient architectural structures and is now integrated with contemporary architecture.

Through my site "<http://aereiemaschereorigami.altervista.org>" I intend to continue updating this work and develop other structures, such as amphitheatres and reticulated structures.

I'm sure that many origamists will be interested in this topic, so I have translated this manual, originally written in Italian, into other languages such as English and Spanish. French is in progress.

Above all, in this book, I wish to engage upon a new path into the domain of "social" origami. By this I mean that origami techniques can be used to promote group activities in whichever context or location, by making use only of a cheap and common material: ordinary paper. In child education, for instance, origami helps children to learn the rules of collaboration and teamwork.

Currently, origami is a craft-artistic activity carried out by a small number of keen fans if we exclude lay-origamists of all ages making for fun paper airplanes or boats. However, there is a myriad of books about origami, amongst which the famous "Yunnito Origami" by Tomoko Fuse deserves to be mentioned.

"The Architect Origamist Manual" is a volume where I intend to offer some rudimentary tools to carry out activities under the supervision of a coach whose main goal is to develop in paper-folders not just manual skill and accuracy, but also logical thinking and creativity.

And in fact, once the art of block-based construction is mastered, the origamist can give free rein to his imagination creating the shapes and the objects he has chosen to construct.

So the task of the tutor would be limited to supervising the activities and intervening only for the hardest steps or the realization of unusual shapes.

Using just common sheets of paper, the tutor can explain techniques for the construction of a wide variety of buildings useful to understanding Middle Age military and religious architecture.

By this three-dimensional construction activity and learning the techniques taught in this book, the reader will witness the improvement of his manual dexterity and, even more important, will experience the enthusiasm and the excitement of creativity.

Let me explain myself better: once the procedure for carrying out blocks and basic components is mastered, the paper-folder can express his creativity, the same way one would if he had at his disposal the well-known fantastic plastic building blocks.

With the exception of circular shapes, the origamist can lay out an architectural project on a chequered paper, on which he will be able to trace the plans and the facades of a building, including complex elements, such as, for example, a church nave, a transept, an apse, a narthex or a matroneum.

June 2015

Arch. Franco Pavarin

Technical advice

Choose very resistant and heavyweight paper or chromo board paper, especially if the building blocks are large and/or meant to be used several times. For example, for the construction of the castle shown on the front cover, given the complexity of the work and the fact that once finished it had to be transported, using cutter and ruler, I have cut very small squares from packing paper of different shades, placing several sheets one on top of the other.

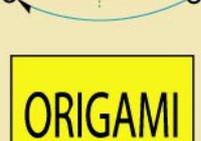

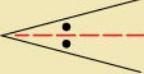

Before building the castle, I have made a freehand drawing of all the facades on a chequered sheet of paper, using the following scale of representation: 1 square = 1 metre of the actual castle = 1/8 of the 8-cm- sided square paper used to make the blocks.

So if we want to construct a building with blocks having the real dimensions, we should use square cardboards whose size is one metre on each side, and we would obtain blocks of 25x25x12.5 cm.

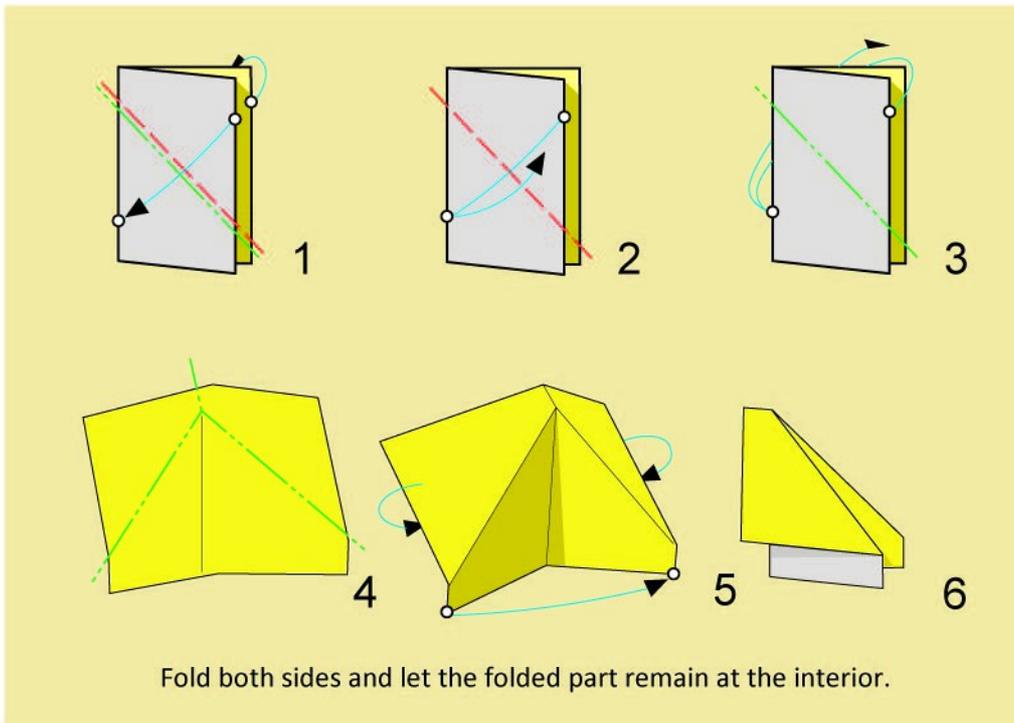

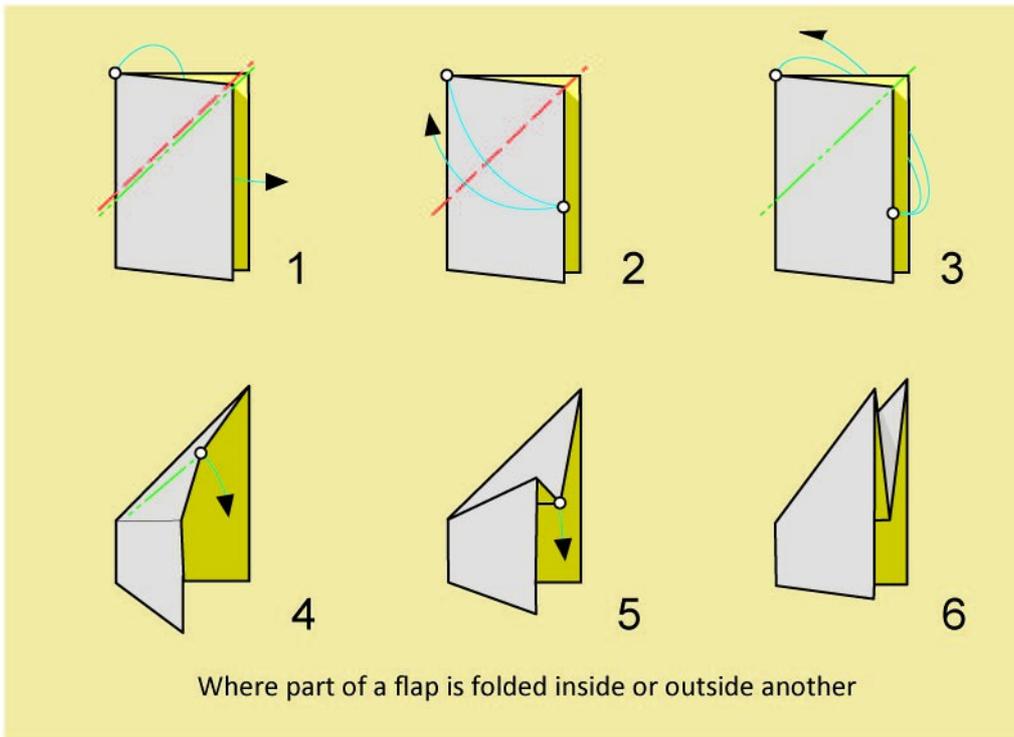

To make a square metre we need 32 blocks, i.e. $(100 \times 100) / (12,5 \times 25) = 32$. The dimension of the openings cannot exceed those of the spaces in the walls, so windows and doors will have the same width along the architrave or lintel, i.e. $25 \times 3 = 75$ cm.

Obviously, if the constructed building had more than one floor, it would not be advisable to climb to the upper floor.

A - BASIC BLOCK

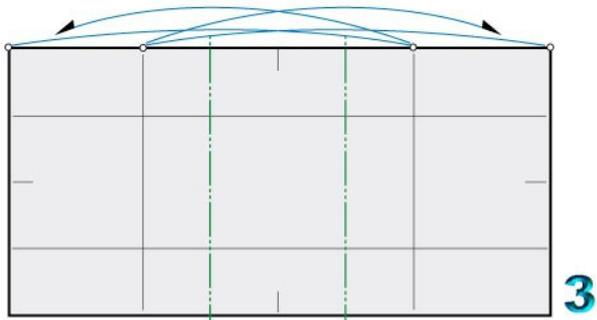

This is the main building block for all constructions and easy to do. Cut in half the square sheet of paper used for all constructions. The effect is improved using heavy paper or light cardboard of a single colour. The building will appear more realistic using slightly different tones of colour.

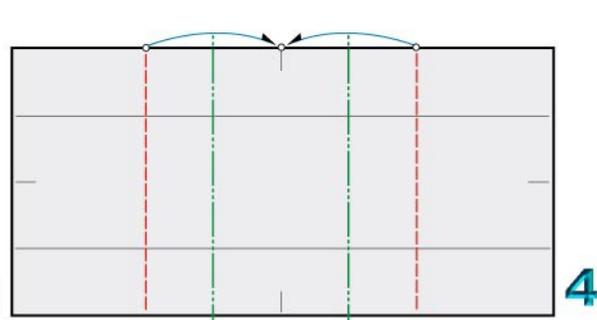

Eseguite prima le 2 piccole pieghe a valle centrali e poi le altre 2 longitudinali

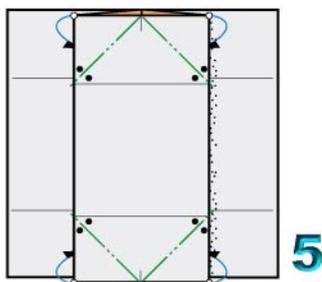

Eseguite prima le 2 piccole pieghe a valle centrali e poi le altre 2 trasversali

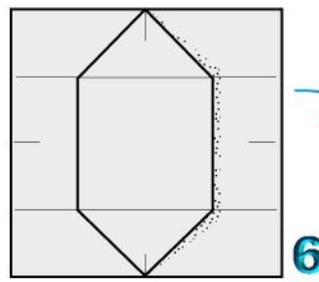

2 pieghe verticali a monte

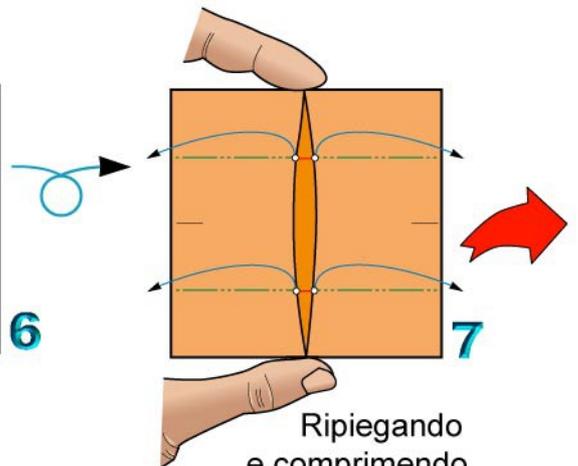

Ruotate ripiegando a valle ed a monte

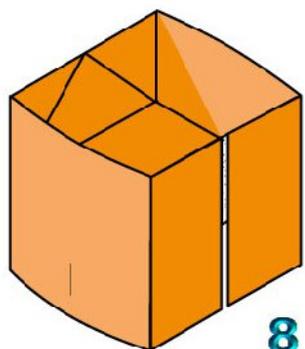

4 pieghe bisettrici a monte e ruotate all'interno

Ribaltate

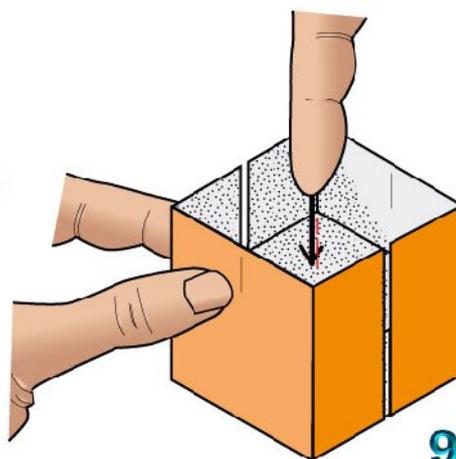

Ripiegando e comprimendo contemporaneamente, aprite modellando 3D

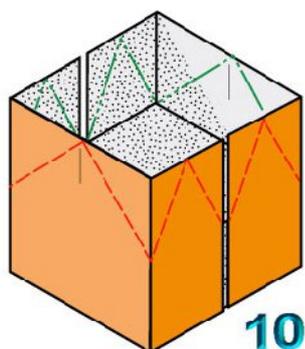

Ribaltate

8

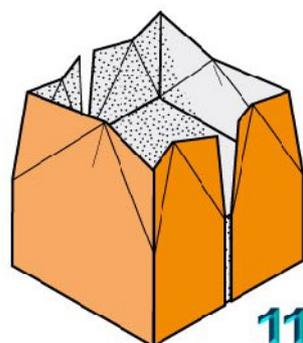

Comprimete gli spigoli e fate rientrare leggermente il fondo

9

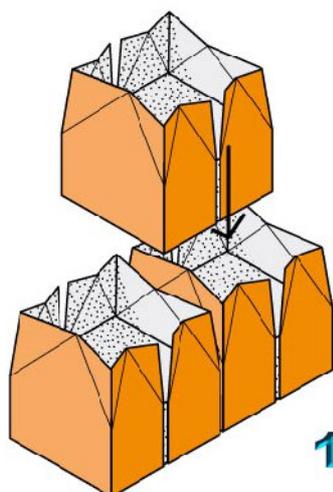

Con una serie di pieghe a valle restringete il perimetro del bordo superiore

10

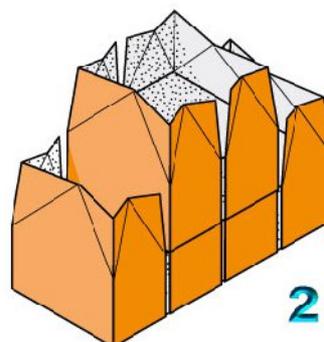

Blocco base A ultimato

11

1

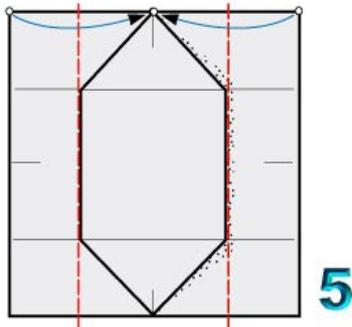

2

ESEMPIO DI UNIONE DI 3 BLOCCHI "A"

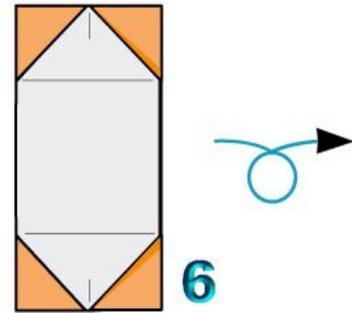

A1 - FLAT BASIC BLOCK

This module is used at the end of a wall or windowsill. In this case, you can use a two-colour paper sheet to simulate the colour of marble.

ESEMPIO DI MURATURA CON FERITOIA

BARTIZAN

A bartizan is a cantilevered wooden structure provided with machilocations, located at the top of a rampart or erected to protect an entrance door. Bartizans could be installed in anticipation of a siege and covered with wet skins to make it flame resistant. In later periods they were made of brick.

It is a very elaborate assemblage and is made with 2 rectangular sheets, 1 for the base and the other for the top.

COSTRUZIONE DELLA BASE

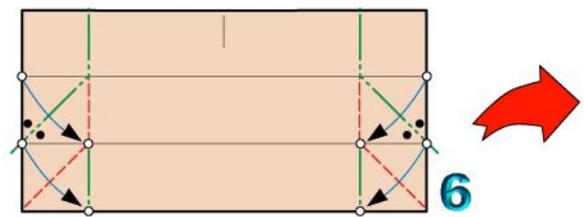

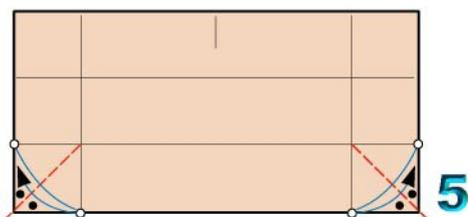

Eseguite prima le 2 piccole pieghe a valle centrali e poi le altre 2 trasversali

2 pieghe a valle e ruotate

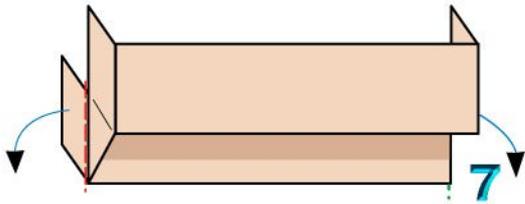

2 pieghe a valle, ruotate e ribaltate

1 piega a valle e ruotate

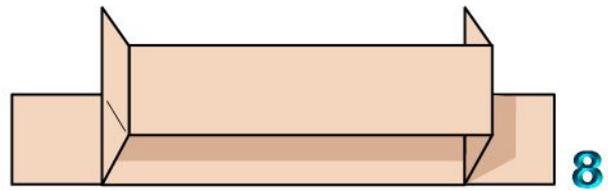

2 pieghe bisettrici a valle

2 pieghe bisettrici a monte e ripiegando a valle ed a monte modellate 3D

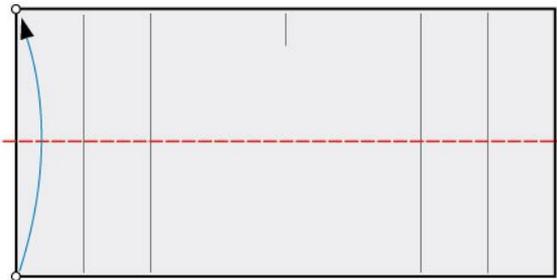

2 pieghe a valle e ruotate le appendici laterali

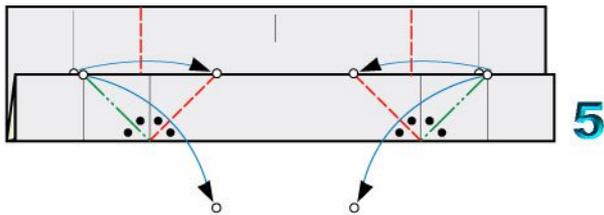

base di bertesca ultimata

COSTRUZIONE DELLA COPERTURA

Pilastro d'appoggio
ultimato

Montaggio del campanile

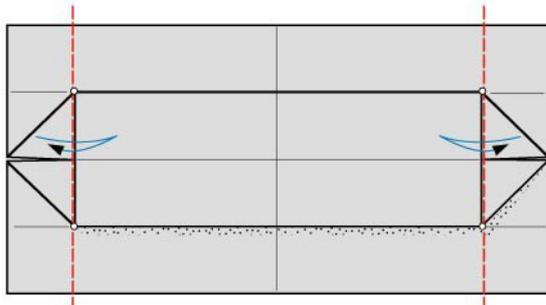

CAMPANILE ULTIMATO

PORCH PORTAL (PROTHYRUM)

It is a small porch with a V-shaped roof. Its function was to protect the main entrance of medieval churches. It is supported by side walls or columns at the base of which animals or fantastic monsters are carved.

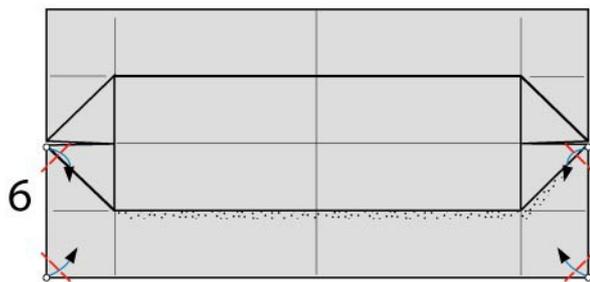

This is done by laying the roof on top of two lateral walls.

COSTRUZIONE DEL TETTO

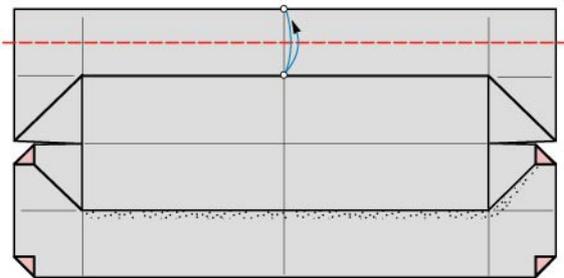

Partite dalla fig. n. 5 del blocco A4.
2 pieghe a valle

6

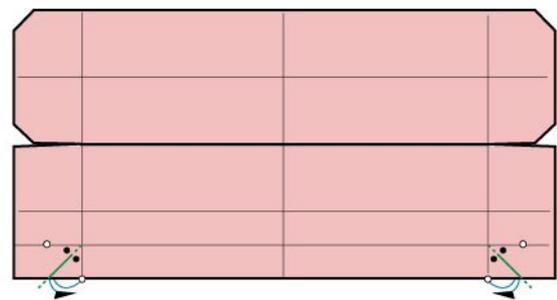

4 piccole pieghe a valle e ruotate

7

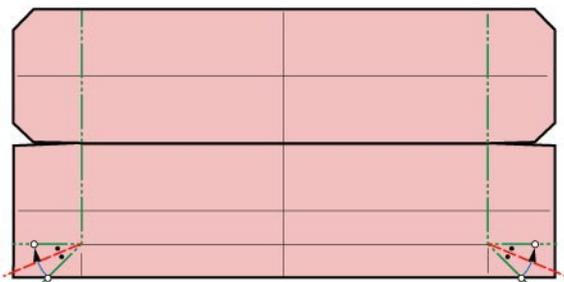

1 piega a valle e ribaltate

8

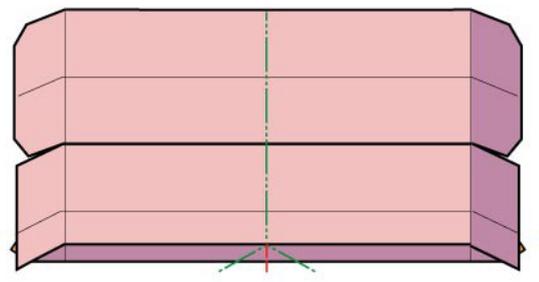

2 pieghe bisettrici a monte

9

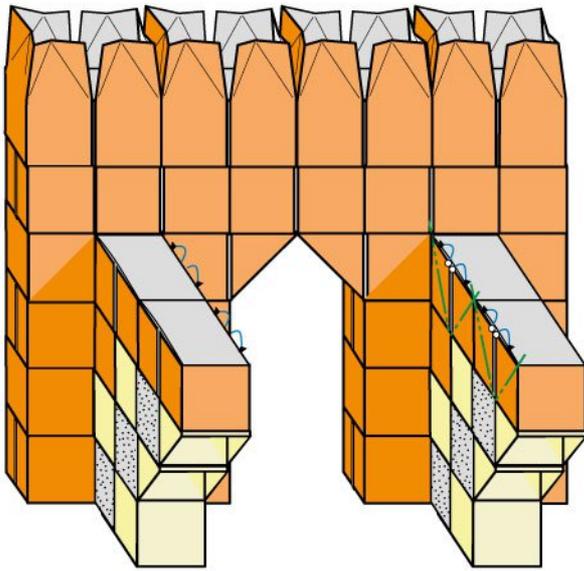

2 pieghe bisettrici a valle e, ripiegando a monte, ruotate 3D

10

2 pieghe bisettrici a monte sullo spessore e modellate il tetto 3D

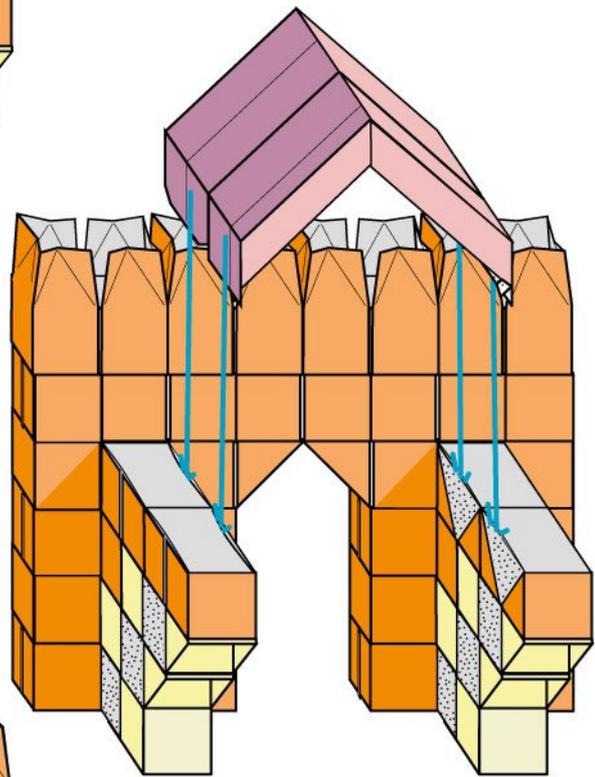

11

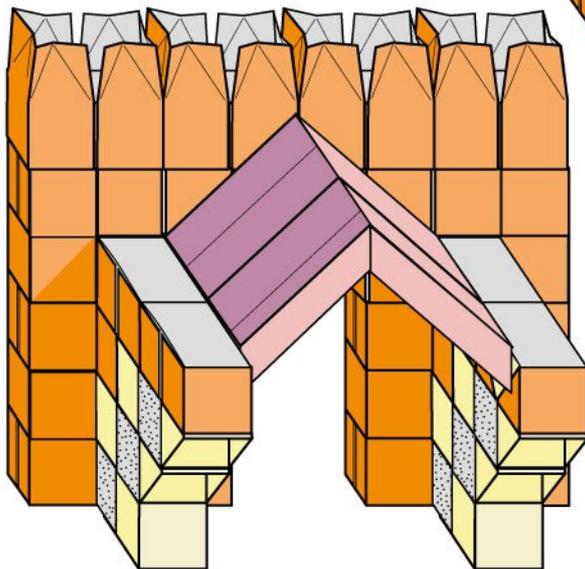

12

Montate il tetto inserendone la base nelle tasche dei blocchi B2

Realizzazione delle 2 spalle con blocchi B3, B1 e B2.
Eseguite 8 pieghe a monte e piegate all'interno i vertici indicati dei 4 semiblocchi B2

13

14

Protiro ultimato

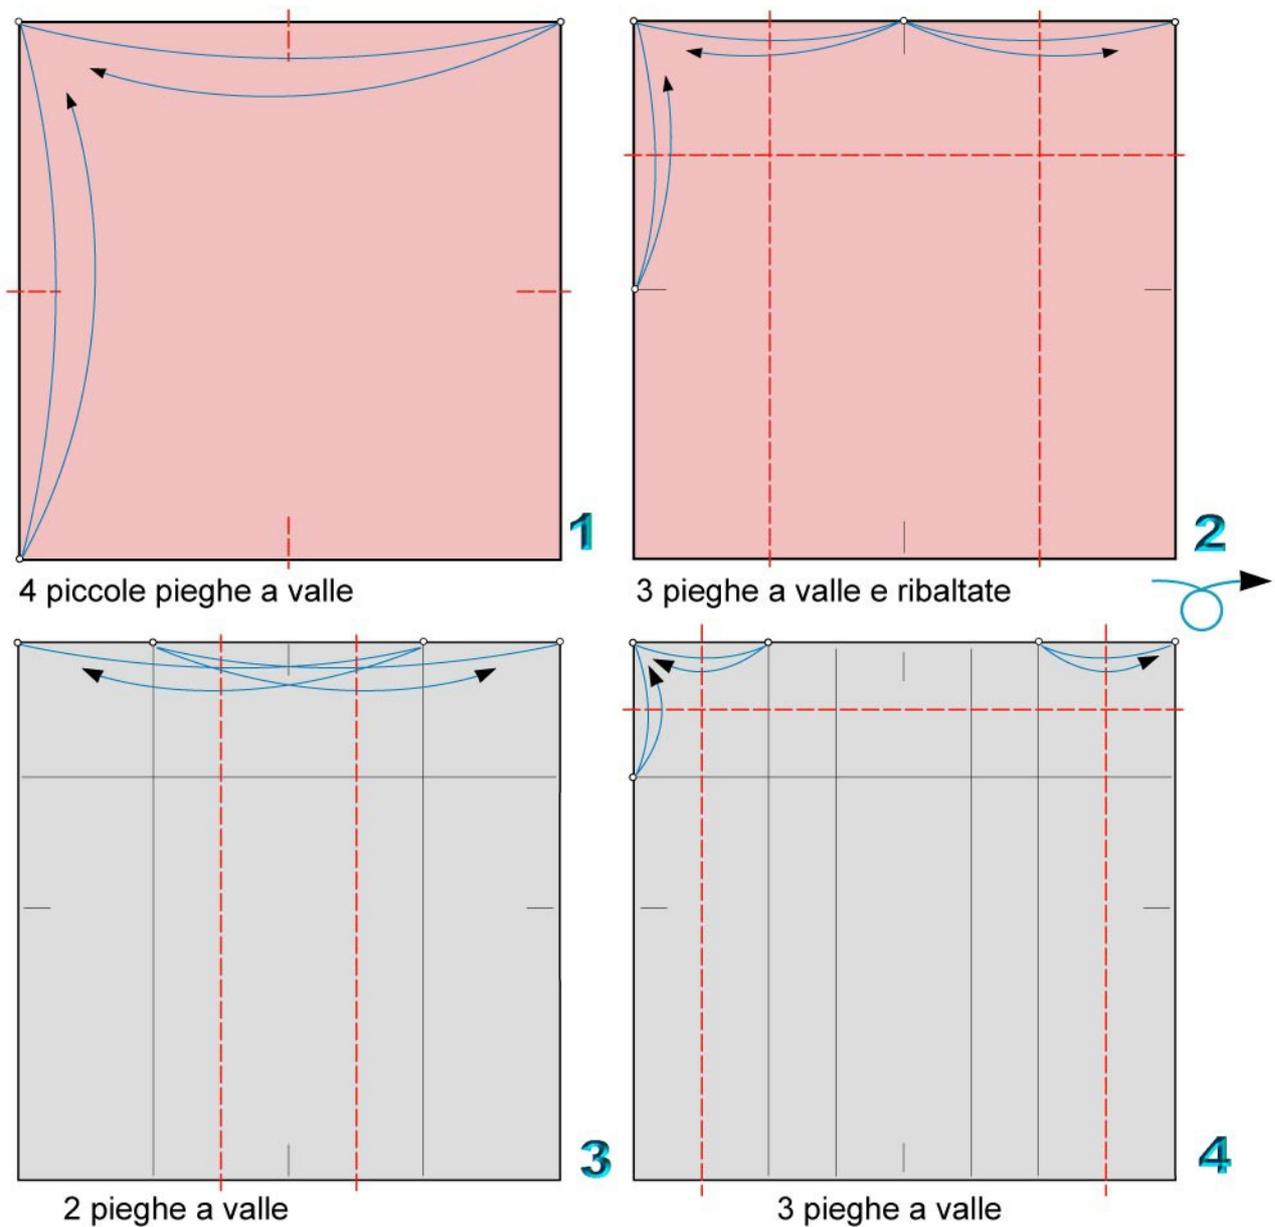

ROOF

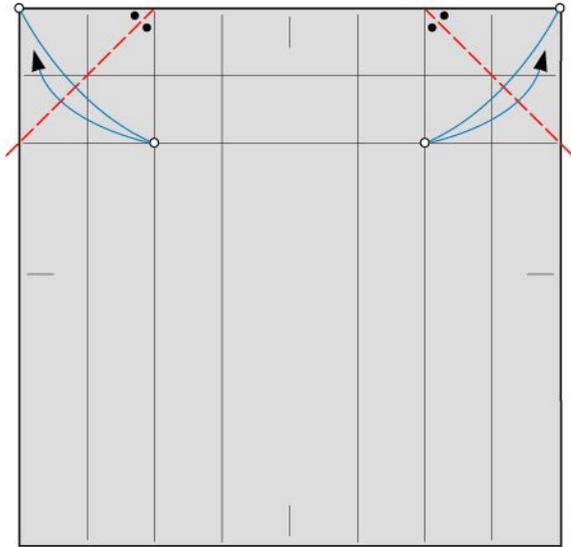

The construction of a large horizontal structure, using the standard pieces of paper, implies the need to create some bracketing in each of them in order to make them more rigid. Furthermore, the creation of a tough locking system is required.

Bracketing, from the aesthetic point of view, stands for the crossbars of a wooden ceiling.

The roof has an inclination of 45° and is made joining a plurality of panels, each formed by a set of modules.

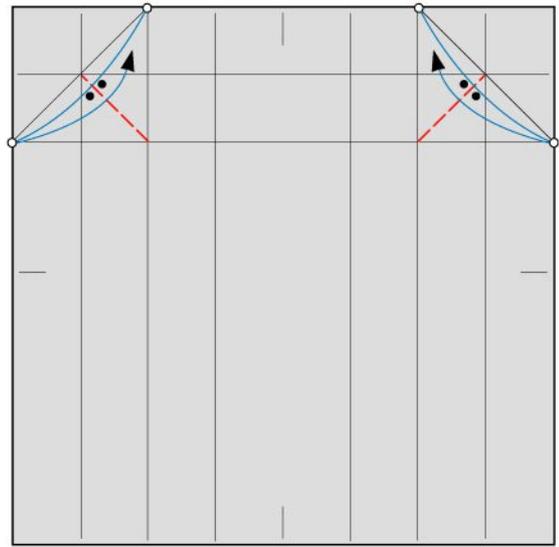

COSTRUZIONE DI UN MODULO PER FORMARE UN PANNELLO SOLAIO O TETTO

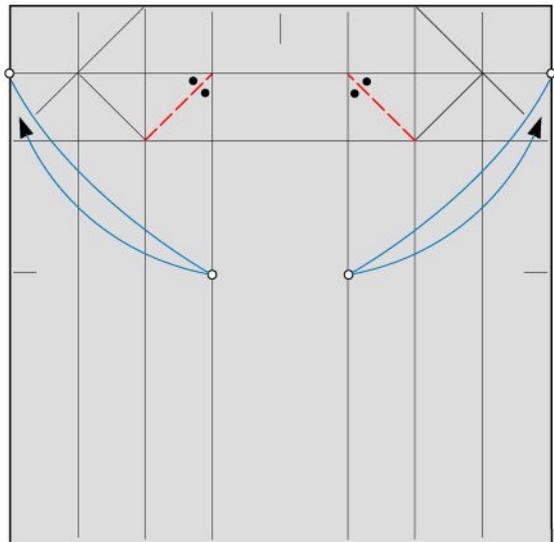

5

2 pieghe bisettrici a valle

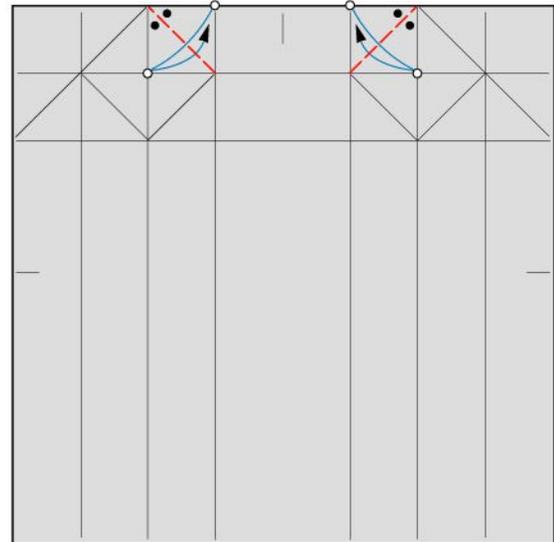

6

2 pieghe bisettrici a valle

7

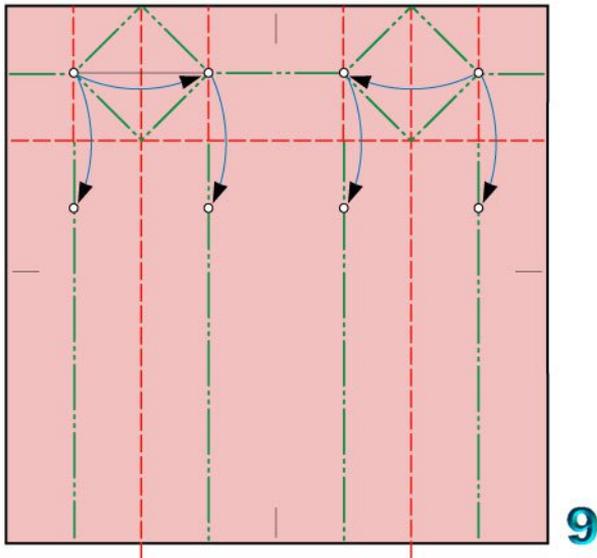

2 pieghe bisettrici a valle

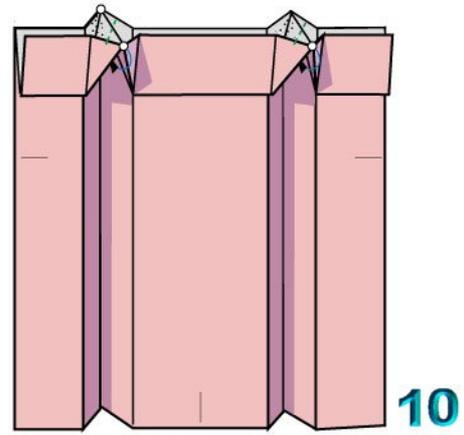

8

Continuate ad aprire

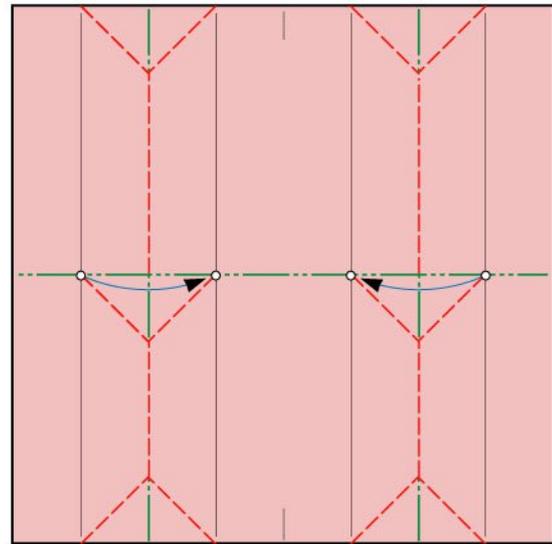

8

2 pieghe bisettrici a valle

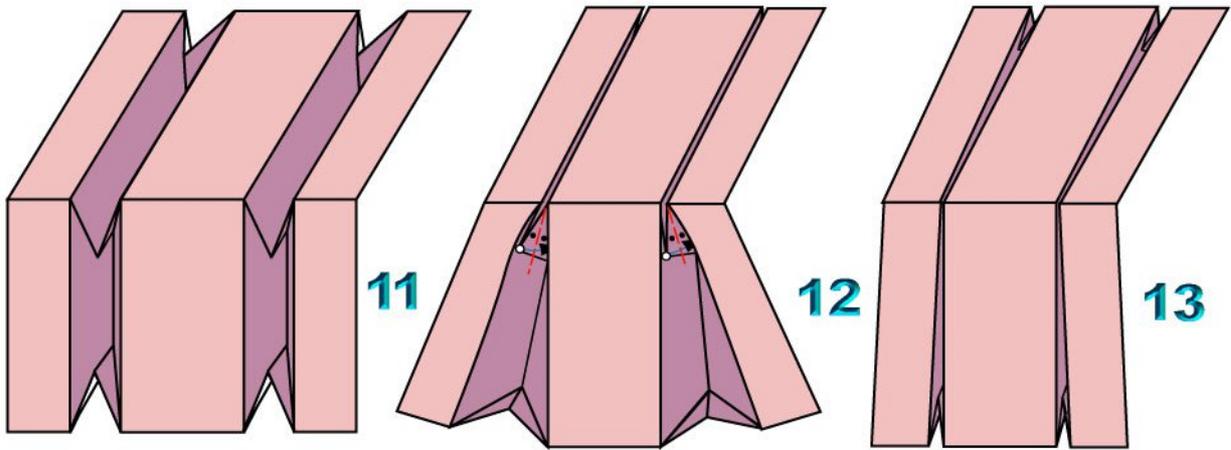

9

2 pieghe bisettrici a valle

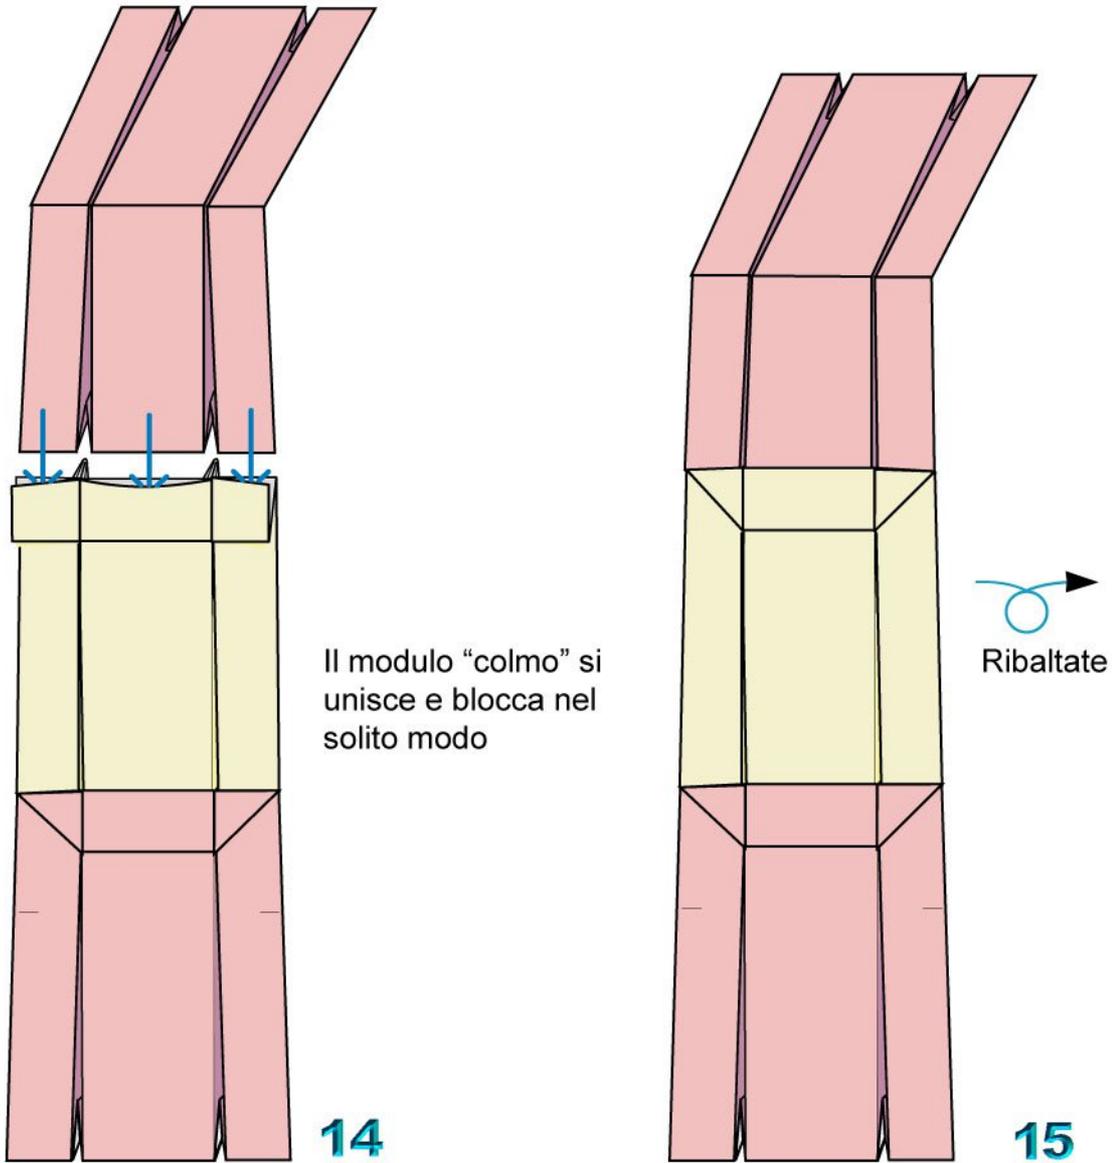

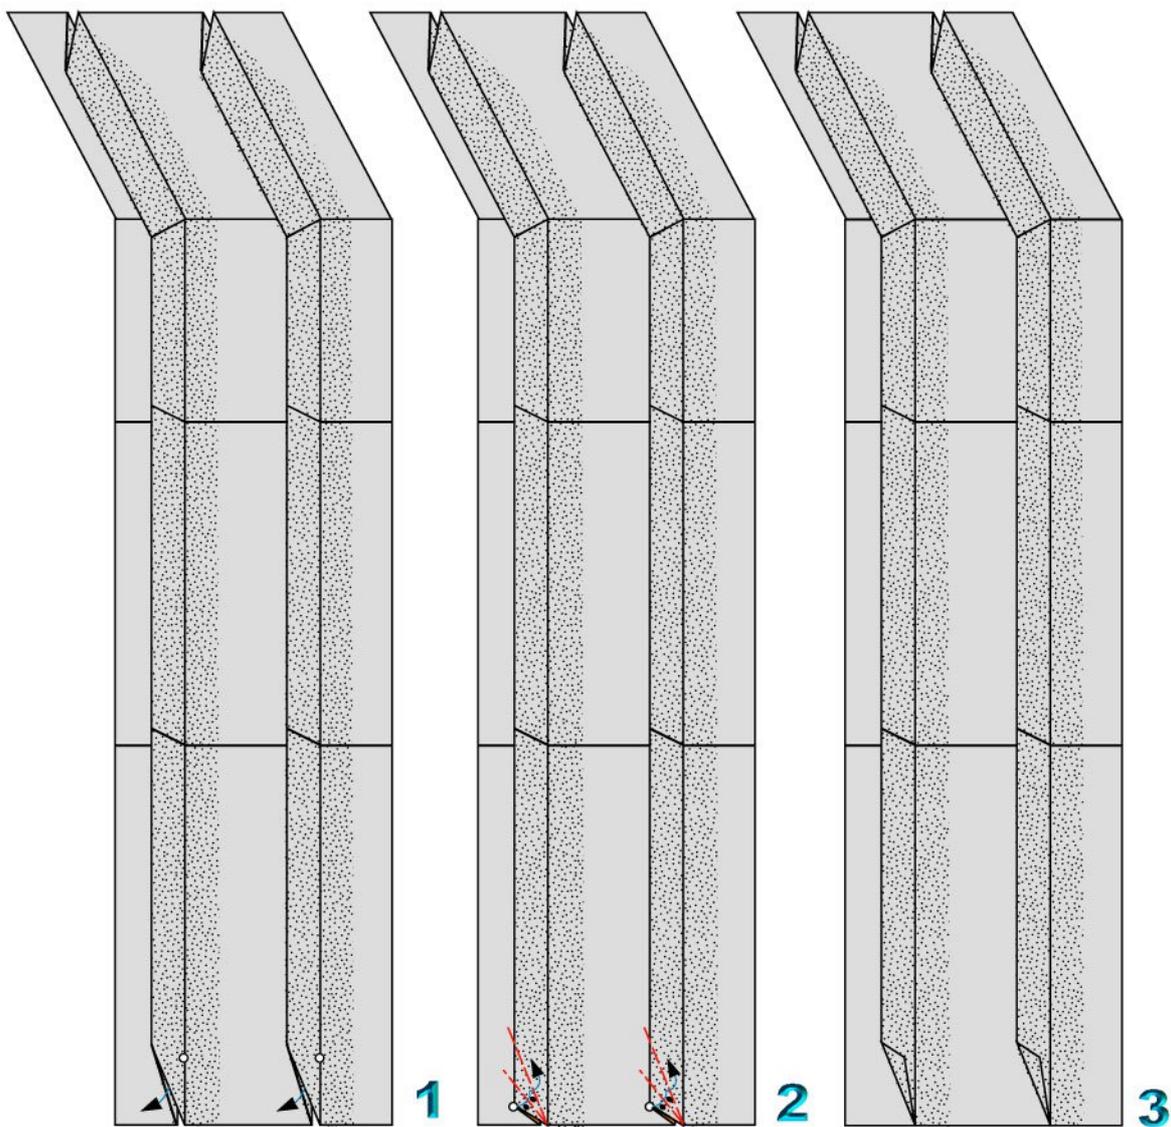

10

Ripiegando a valle ed a monte modellate 3D

Eseguite 2 piccole pieghe a valle per bloccare le nervature in posizione chiusa

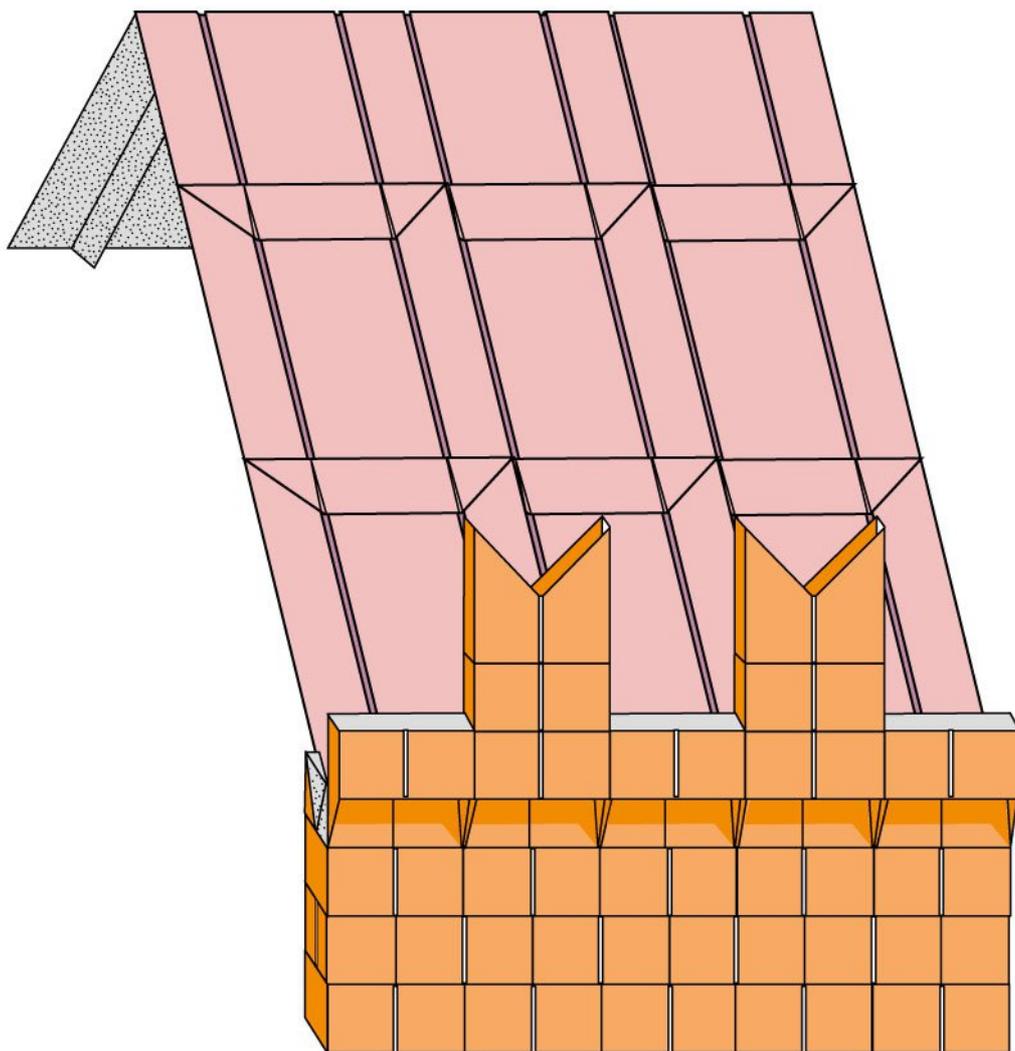

L'estremità del pannello tetto va elaborata per poterlo appoggiare sui supporti

Le estremità delle nervature si ripiegano 2 volte a valle

Vista inferiore del pannello tetto ultimato

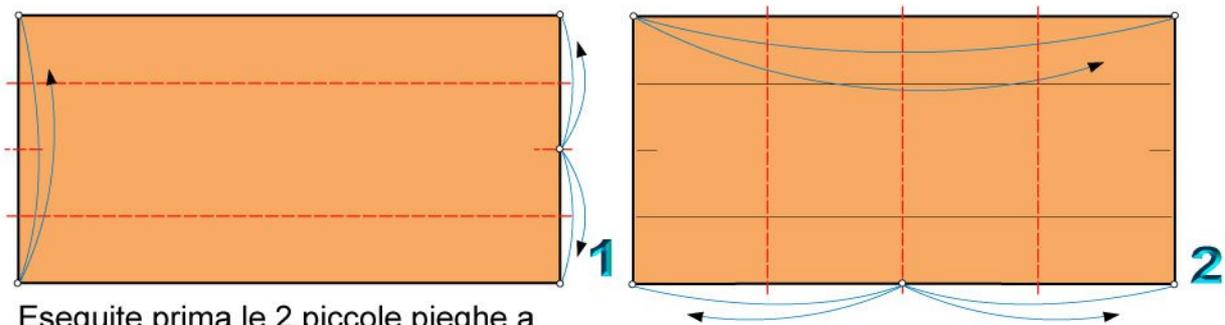

ESEMPIO DI TETTO APPOGGIATO SU UN SUPPORTO MURARIO,
IN QUESTO CASO UN CAMMINO DI RONDA CON PIOMBATOIE

COSTRUZIONE BLOCCO PER TIMPANO

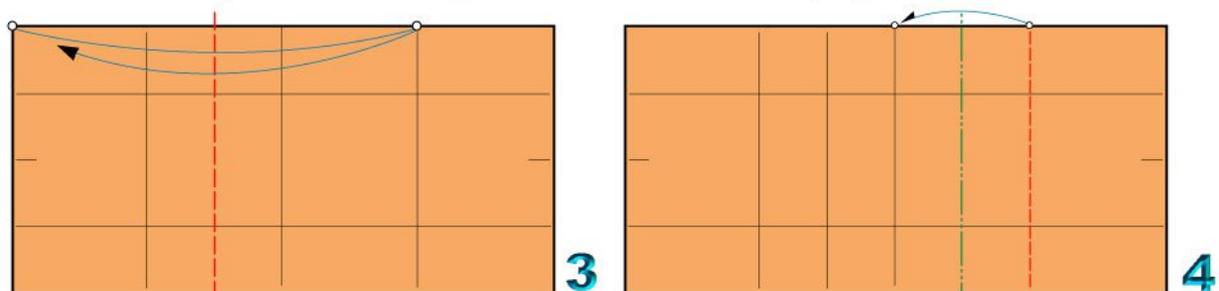

Il timpano è quella parte di muro di forma triangolare compresa tra 2 falde di muro, sulla quale si appoggia lateralmente il solaio del tetto.

Il blocco che si costruisce consente unicamente la realizzazione di timpani di 45°.

Eseguite prima le 2 piccole pieghe a valle centrali e poi le altre 2 longitudinali

3 pieghe a valle

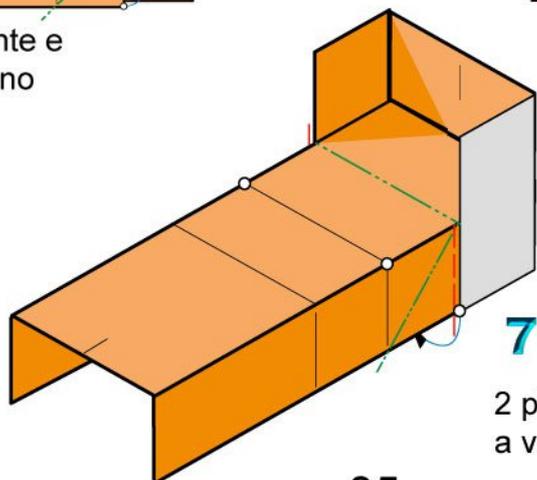

1 piega a valle

1 piega a monte e ruotate ripiegando a valle

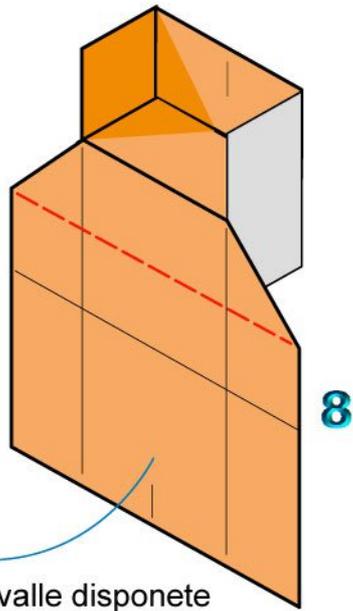

2 pieghe a monte e ruotate all'interno

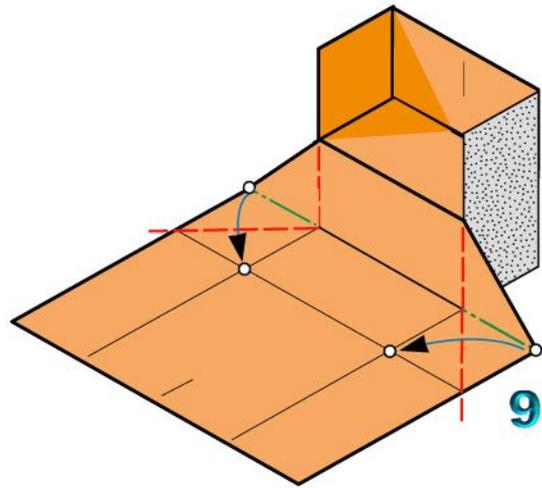

Ripiegando a valle ed a monte modellate 3D

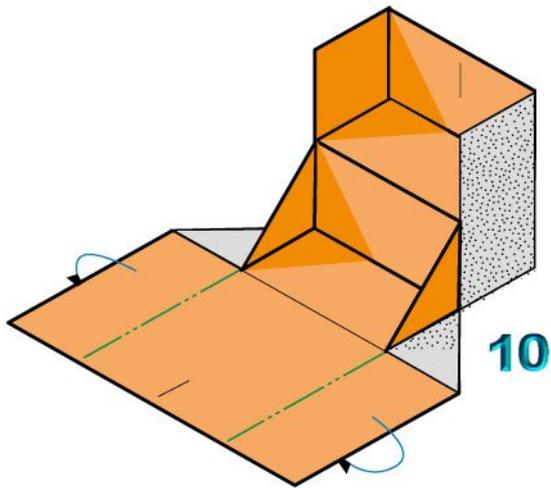

2 pieghe a monte e, ripiegando a valle, modellate 3D

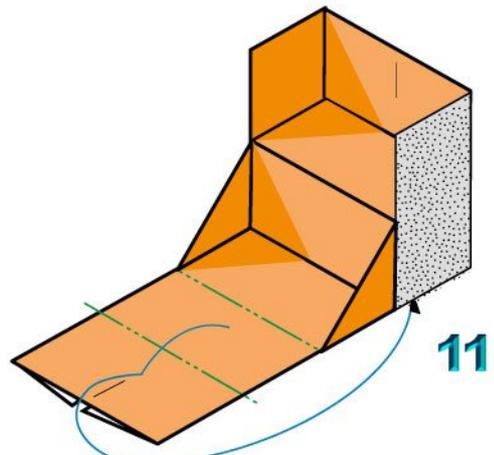

ripiegando a valle disponete
orizzontalmente il rettangolo indicato

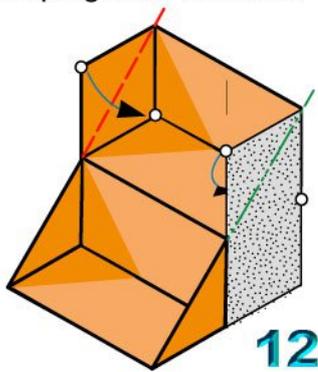

2 pieghe rovesce interne

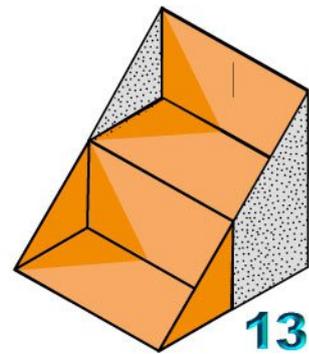

ruotate ripiegando a monte

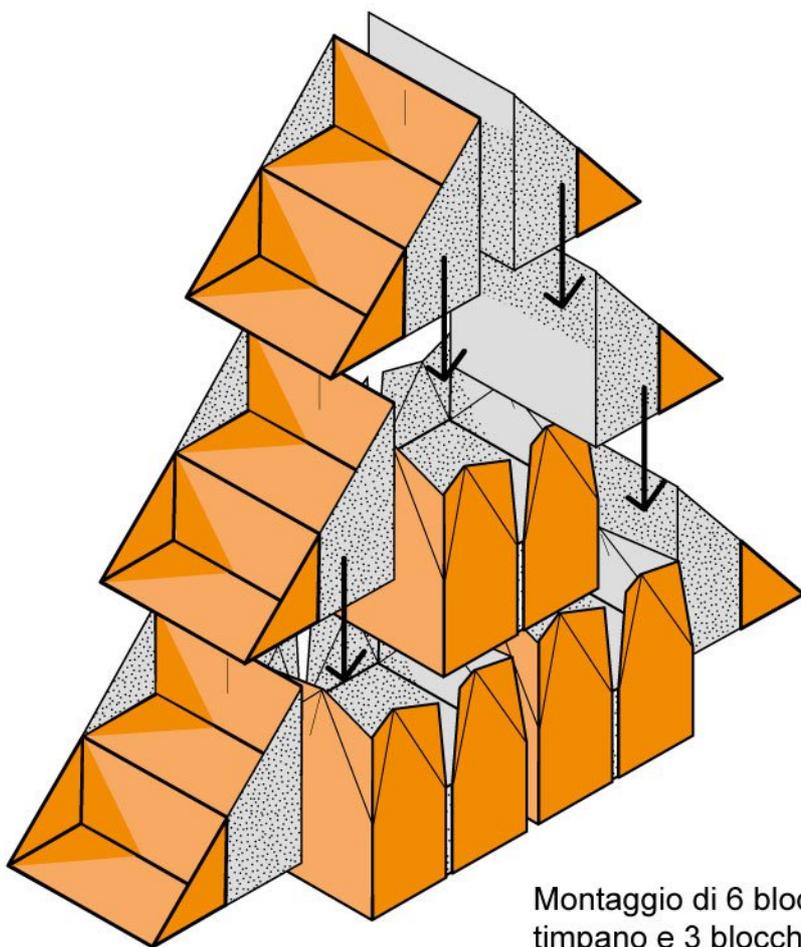

ruotate ripiegando a monte
e intascate all'interno

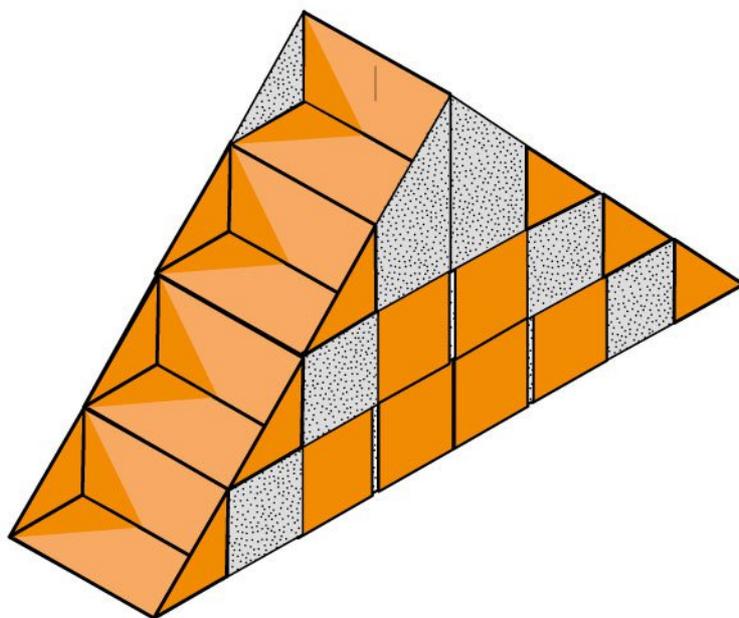

2 pieghe a monte, 1 per lato

Blocco per timpano ultimato

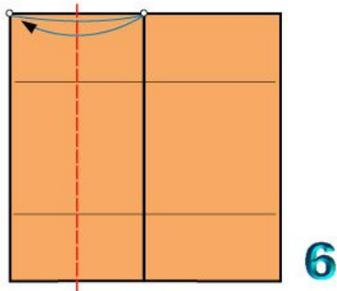

Montaggio di 6 blocchi per timpano e 3 blocchi A

ESEMPIO DI TIMPANO ULTIMATO

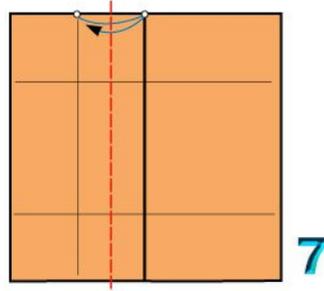

COSTRUZIONE DEL SUPPORTO MENSOLA PER TETTO

Blocco che consente il montaggio del tetto con cornicione a sbalzo e con grondaia

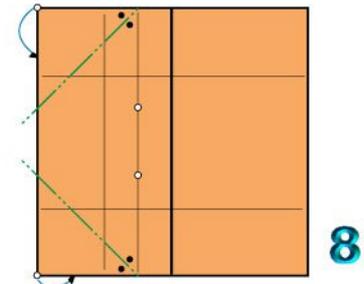

6

Partite dalla fig.n.6 del blocco A; 1 piega a valle

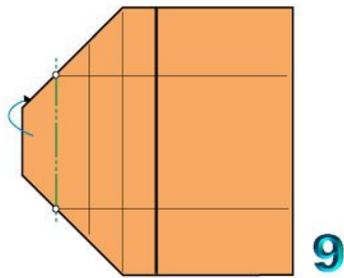

7

1 piega a valle solo sulla sup. in vista

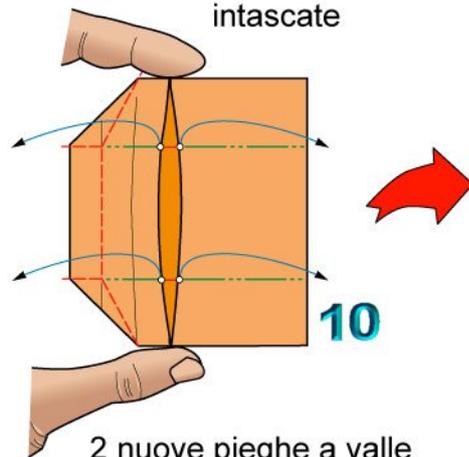

8

2 pieghe bisettrici a monte, ruotate ed intascate

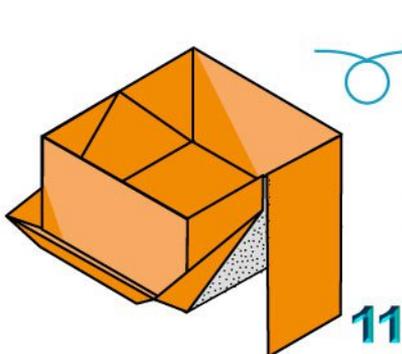

9

1 piega a monte e ruotate

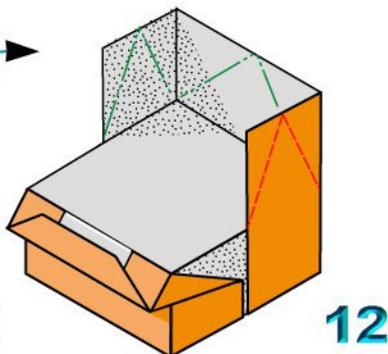

10

2 nuove pieghe a valle e, ripiegando a valle ed a monte, modellate 3D

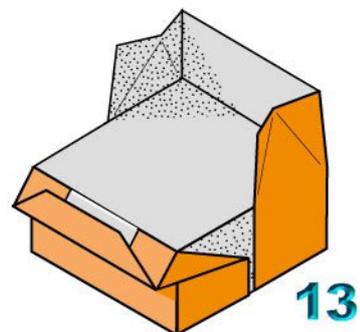

11

ribaltate

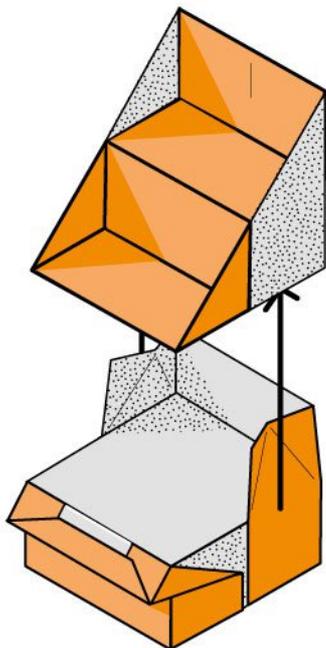

12

con una serie di pieghe a valle restringete il perimetro superiore

13

supporto mensola per tetto ultimato

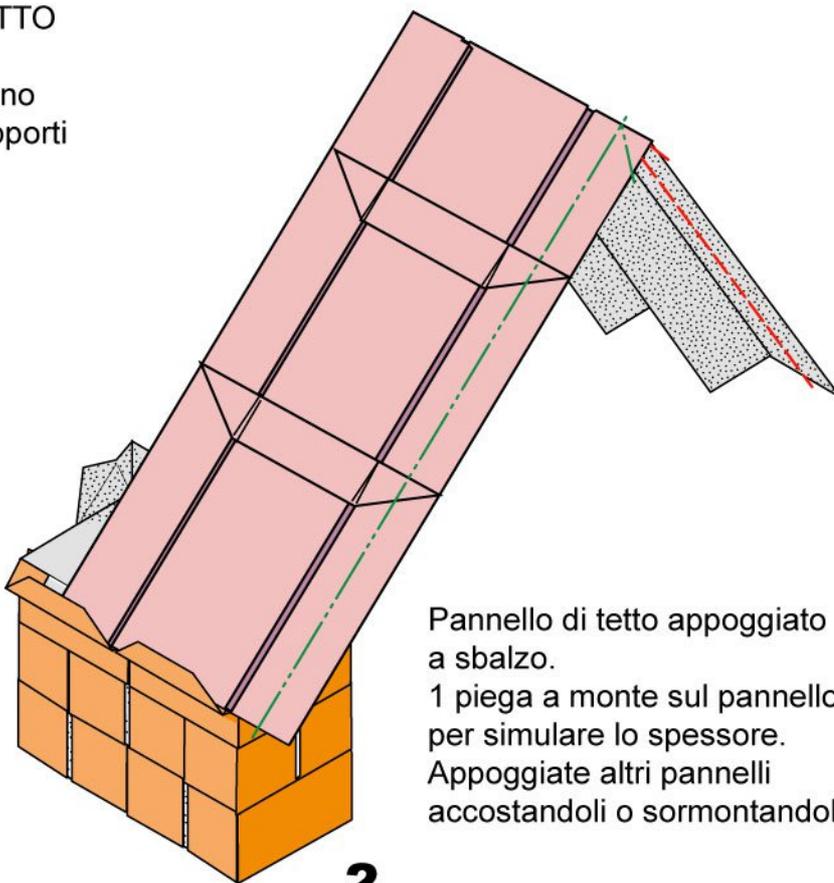

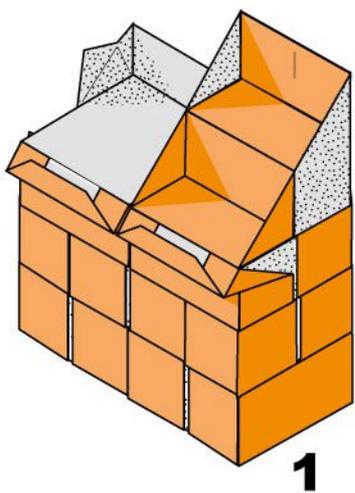

supporto mensola per tetto con
inserito un blocco per timpano ultimato

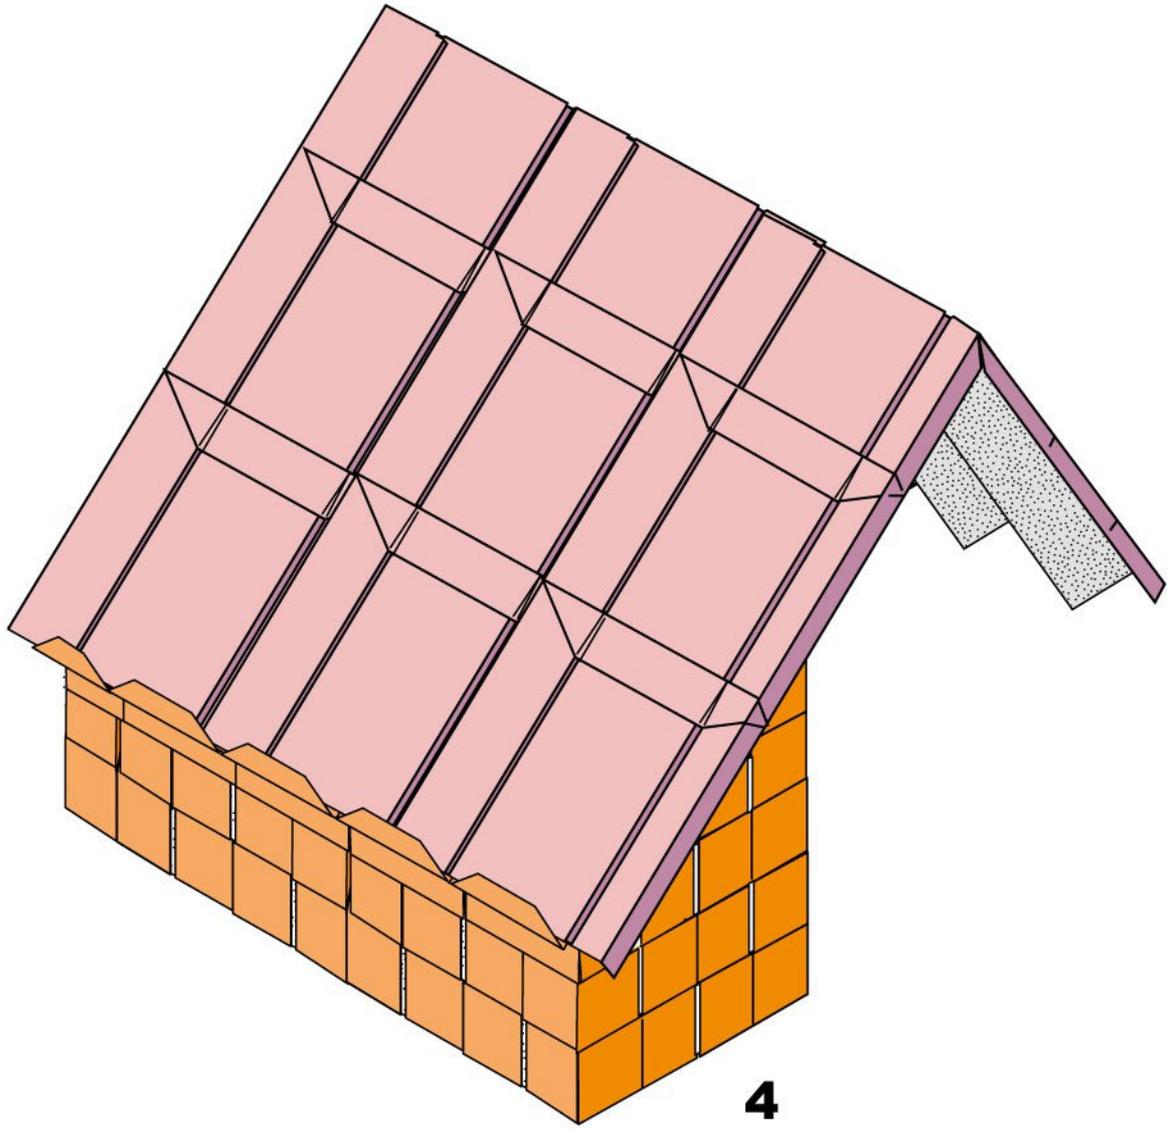

inserimento di un blocco per timpano
in un supporto mensola tetto

COSTRUZIONE DI UN TETTO

Inserite un blocco per timpano
sul primo di una serie di supporti
per mensola

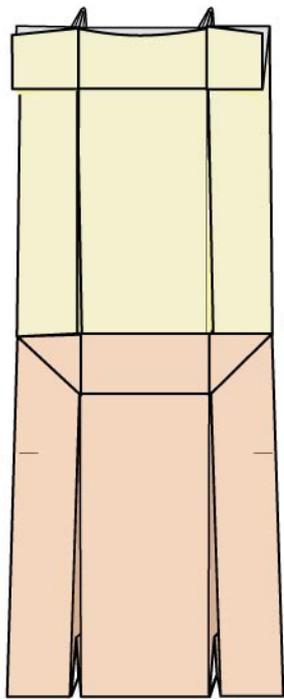

Pannello di tetto appoggiato
a sbalzo.
1 piega a monte sul pannello
per simulare lo spessore.
Appoggiate altri pannelli
accostandoli o sormontandoli

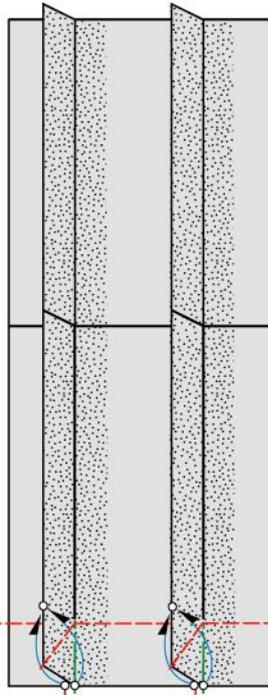

ESEMPIO DI TETTO CON 3 PANNELLI

LARGE FLOOR SLAB

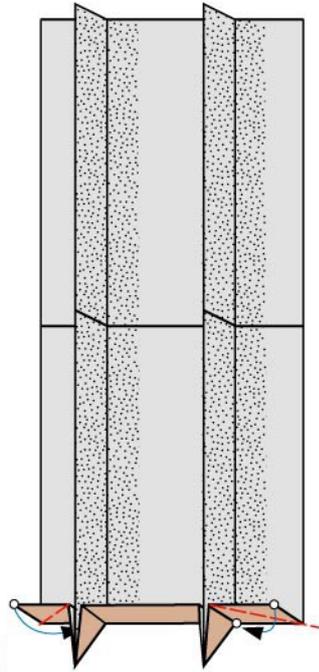

14

Ribaltate

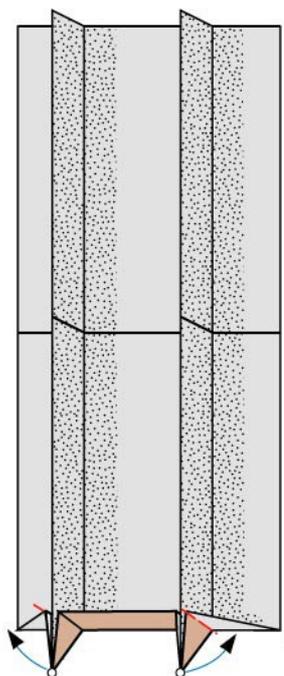

15

2 pieghe rovesce esterne

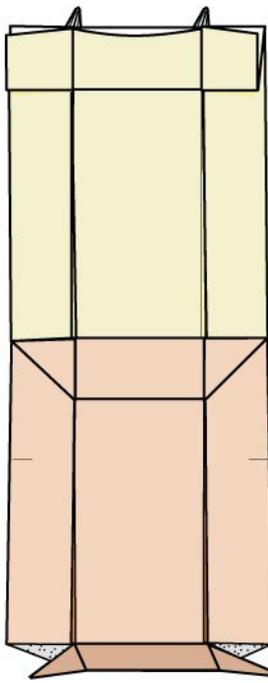

16

2 pieghe a valle e ruotate

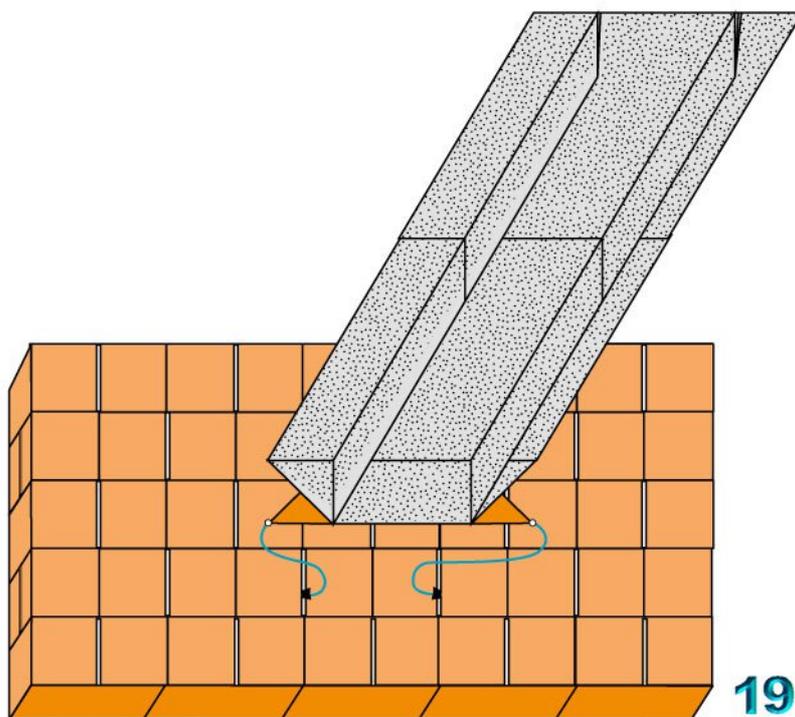

17

“Aprite” ruotando a valle

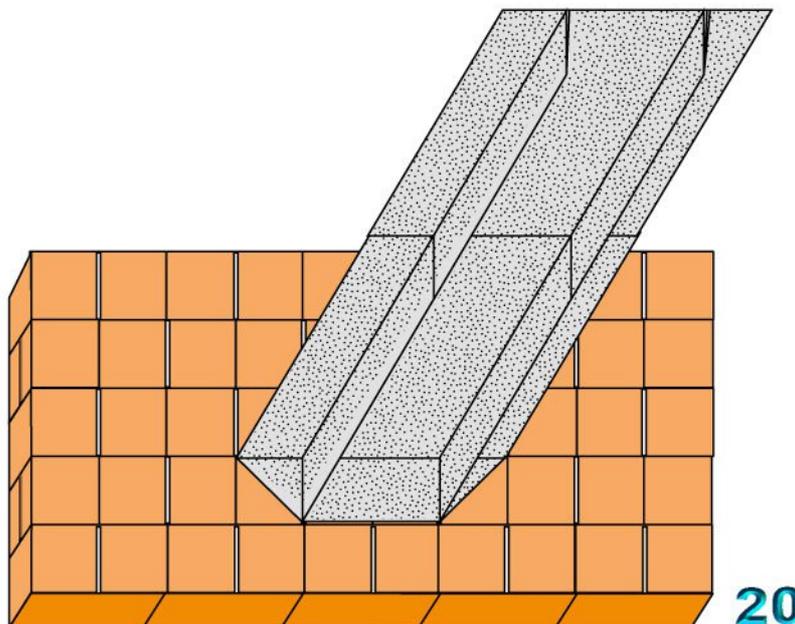

18

Pannello pronto per essere agganciato

19

Il solaio si vincola alle pareti inserendone i vertici nelle fessure presenti nel centro dei blocchi base A

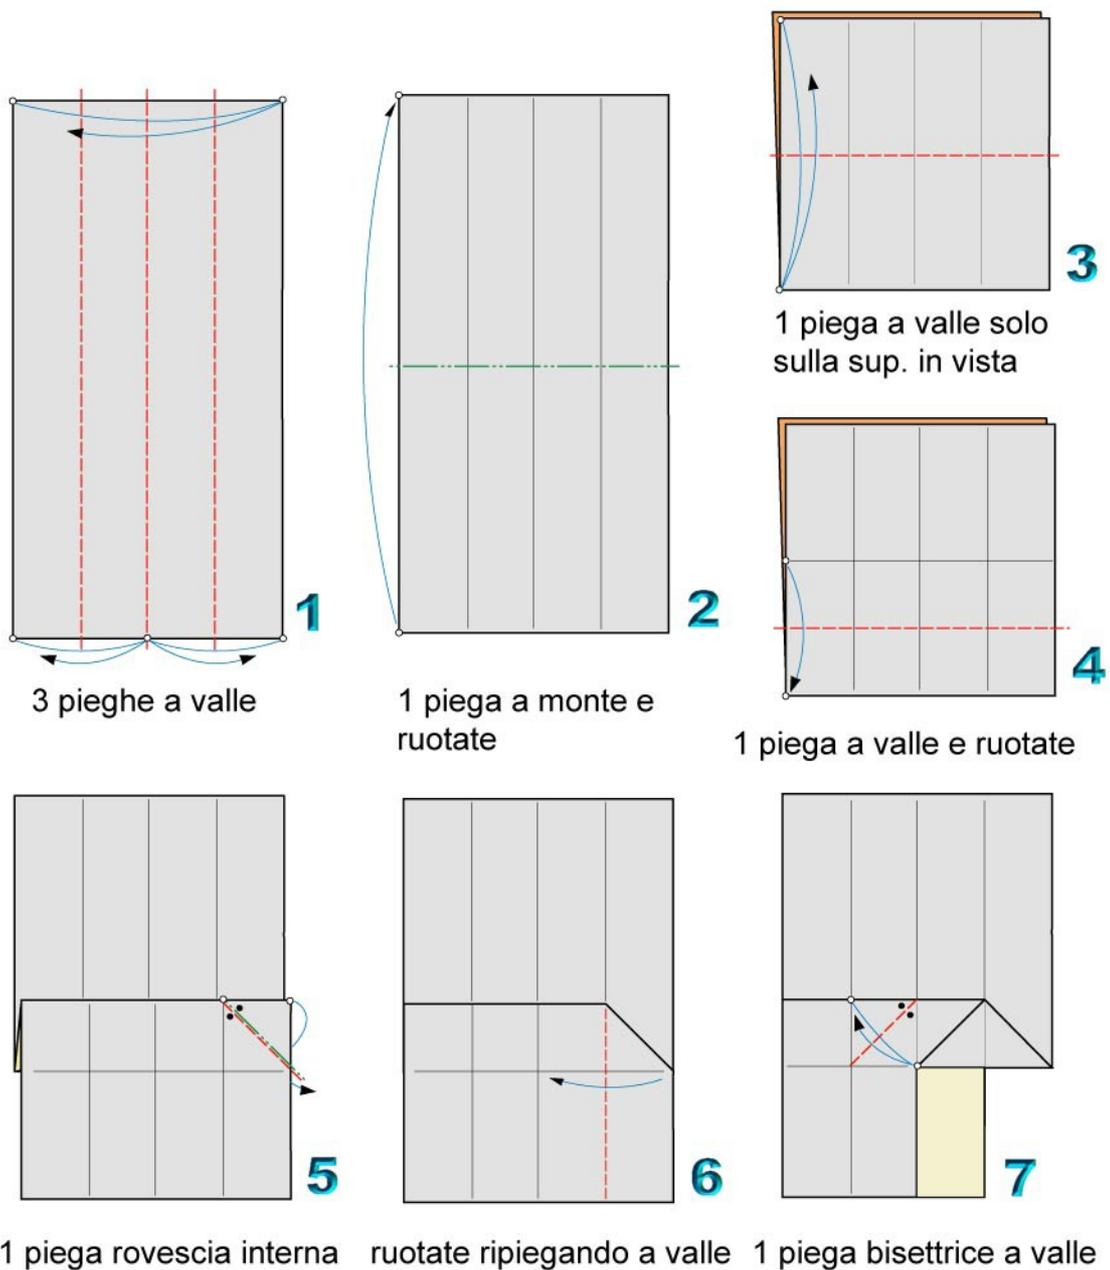

20

PANNELLO DI SOLAIO FISSATO ALLA PARETE

ROSE WINDOW

The main window of Romanesque and Gothic churches is large in size and circular in shape. It is found above the entrance of the nave and transepts. The rose window was usually adorned with stone decorations and colourful stained glass.

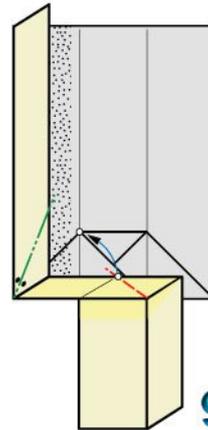

The 8 modules form the structure in stone around and holding the stained glass.

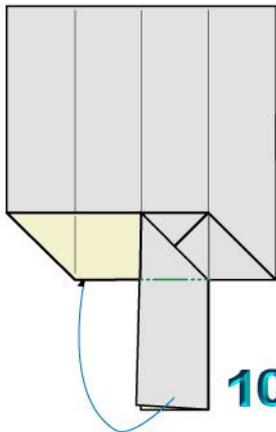

8

1 piega a monte e, ripiegando a valle ed a monte, modellate 3D

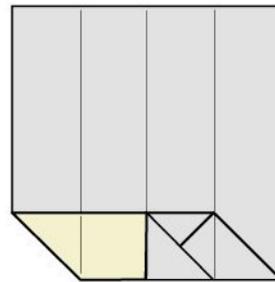

9

mediante 2 pieghe, 1 a valle ed 1 a monte, ruotate 2D

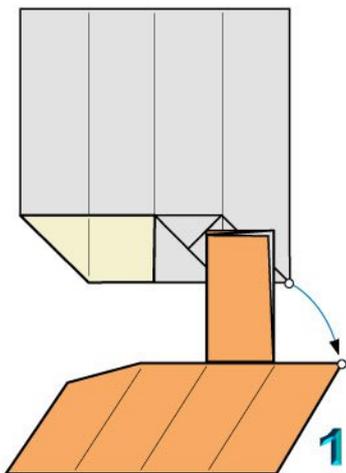

10

1 piega a monte e ruotate

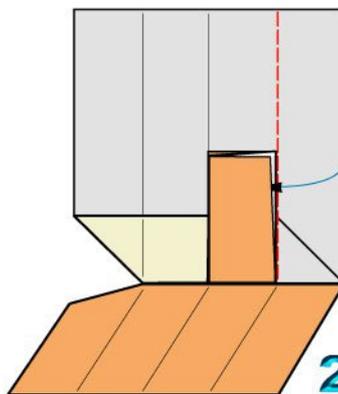

11

modulo pronto per il montaggio: costruitene altri 7

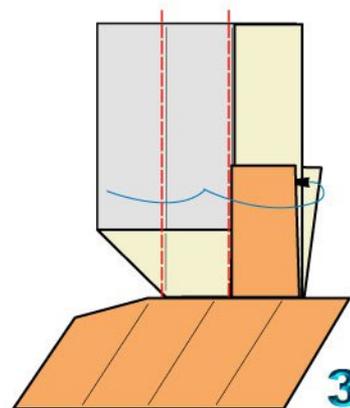

1

Unione di 2 moduli

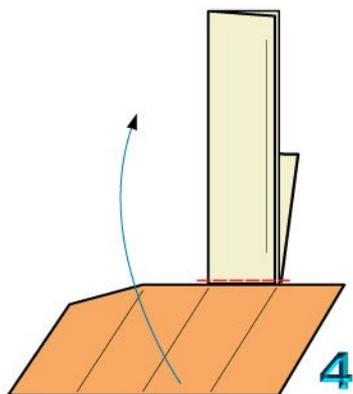

2

Ripiegando a valle intascate il bordo indicato

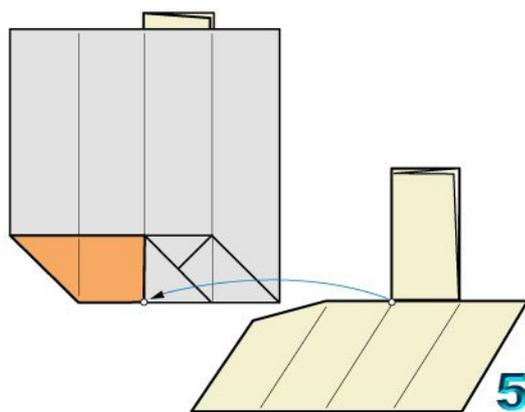

3

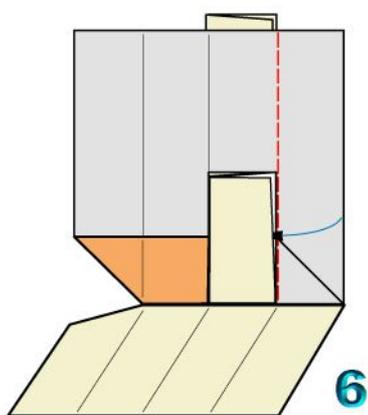

Ripiegando 2 volte a valle intascate il bordo indicato

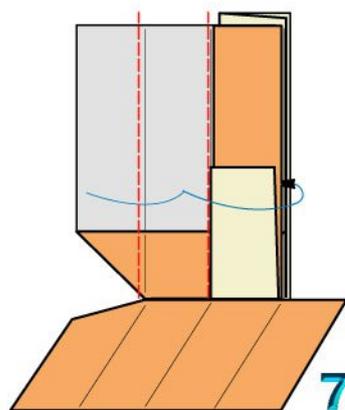

Ruotate la superficie indicata **4**

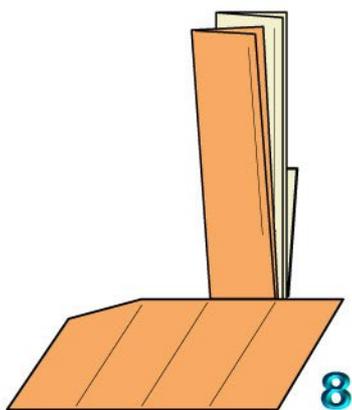

Sovrapponete un nuovo modulo **5**

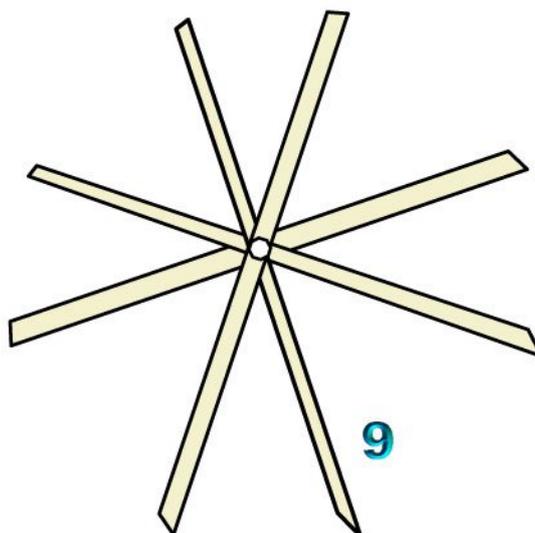

Ripiegando a valle intascate il bordo indicato **6**

Ripiegando 2 volte a valle intascate il bordo indicato **7**

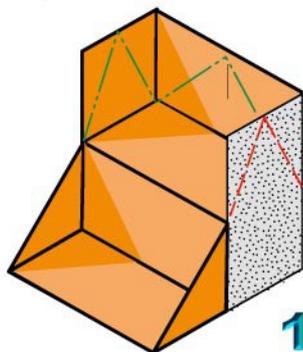

Ripetete altre 6 volte la costruzione come già effettuato precedentemente **8**

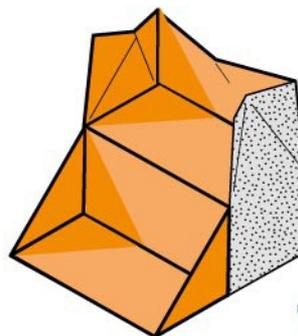

Uniti 8 moduli, la decorazione è ultimata. Inseritene le estremità nelle fessure tra un blocco e l'altro **9**

Per costruire la parte inferiore del rosone sono necessari 2 blocchi per timpano e 2 blocchi per timpano modificati:

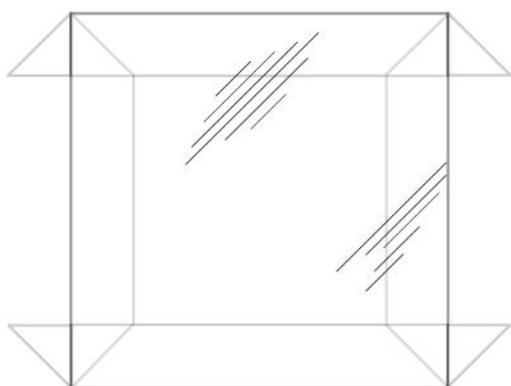

12

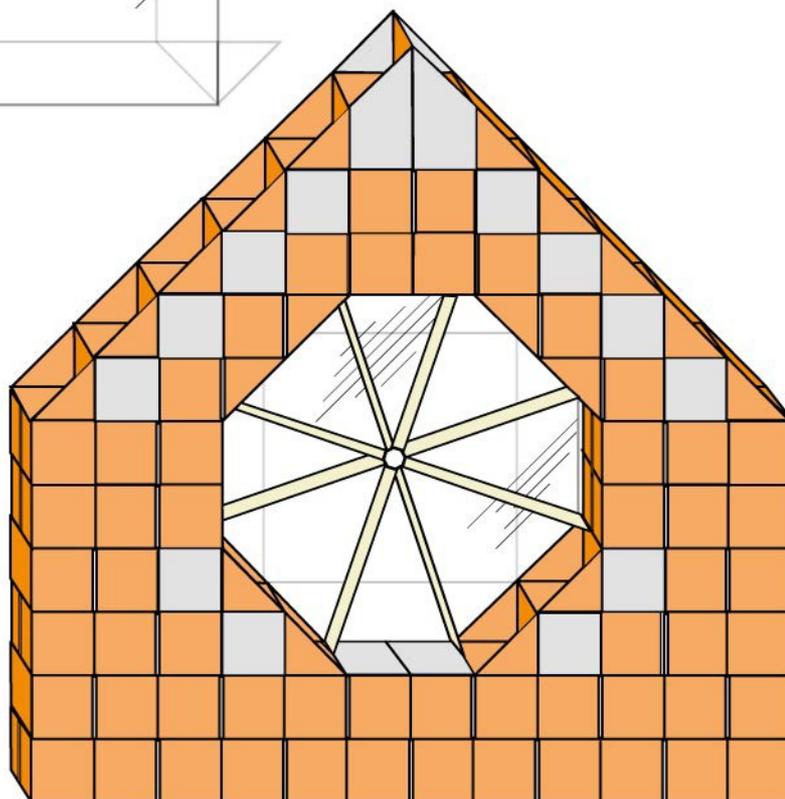

13

Partite dalla fig. n. 11 del blocco per timpano. Eseguite una serie di pieghe a valle per diminuire il perimetro superiore

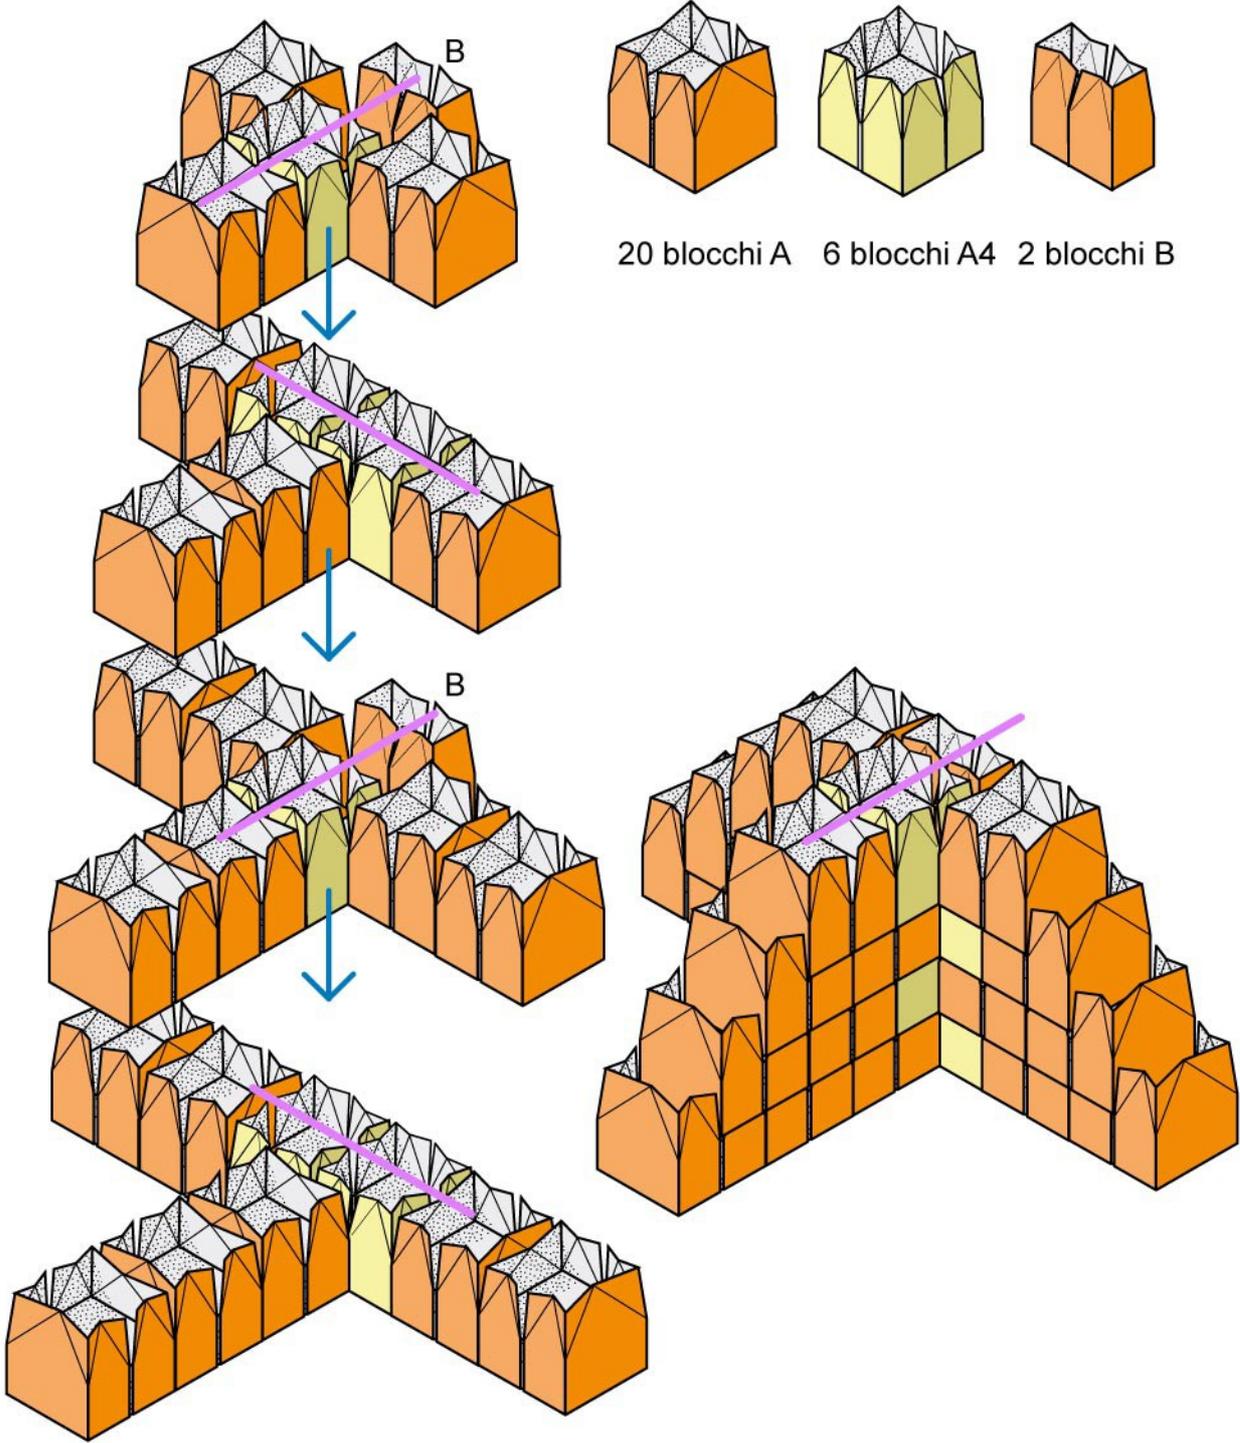

Insert a ceiling module on the back built with transparent acetate to simulate the glass and block it by inserting the vertices in the slits of the wall; including modular elements.

ESEMPIO DI ROSONE

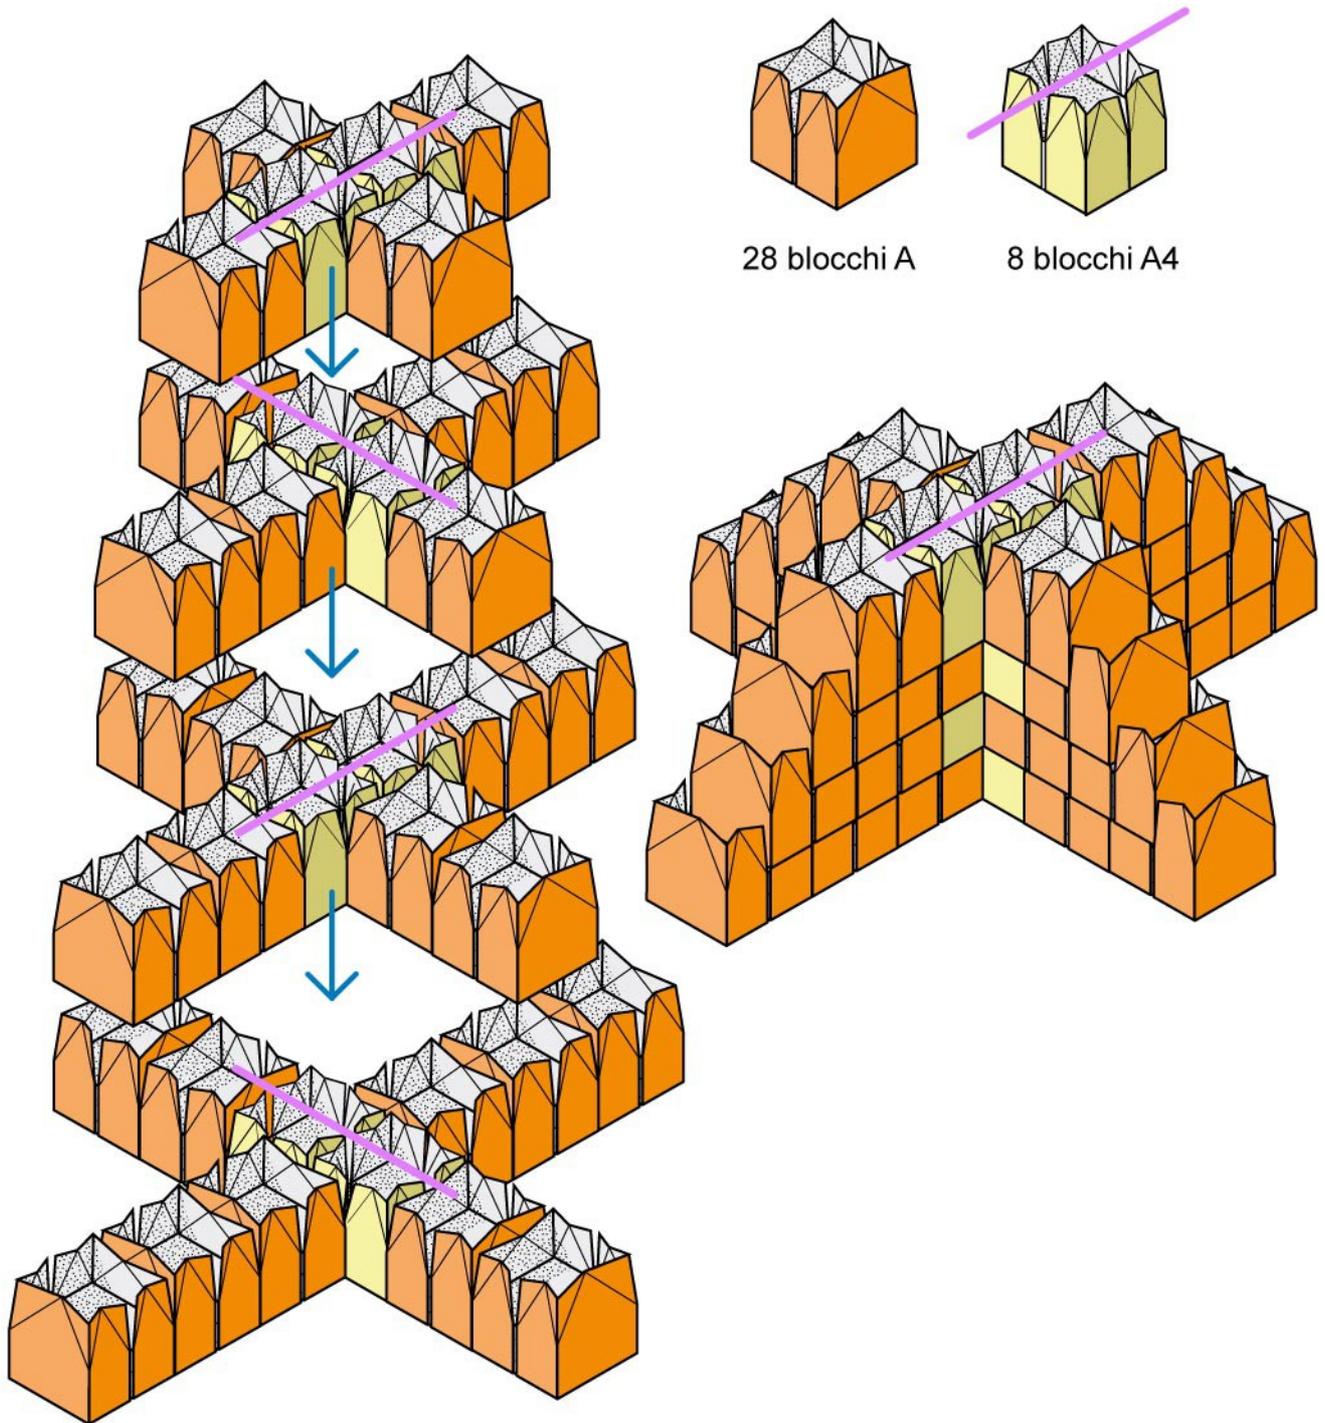

T-SHAPED WALL

T-shaped walls require 1 or 2 A4 special blocks and one half size B block every other level. The weakest part must be kept on the inside.

CROSS WALLS

Two A4 special blocks for each level are necessary to join two cross walls. The weakest part must be kept inside.

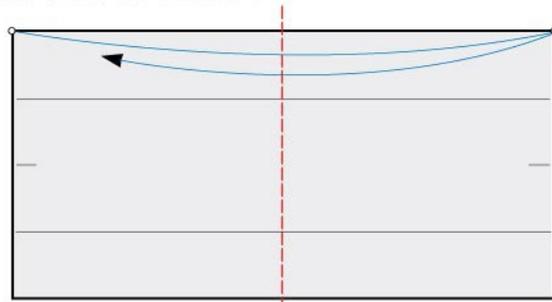

C1 - LARGE MAIN BEAM

This structural element allows the creation of openings equal to 6/8 of the sheet size. Three sheets are required for its construction; two identical leaves are joined by the long side to the central element which should be constructed with solid paper or cardboard.

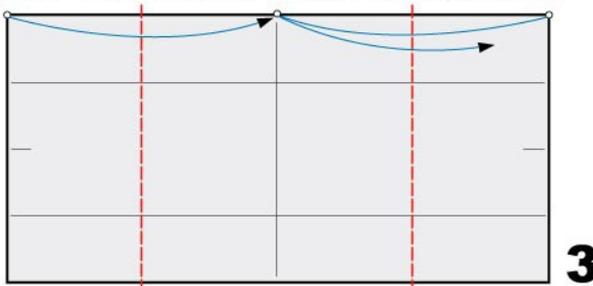

COSTRUZIONE DEL MODULO DI TESTA

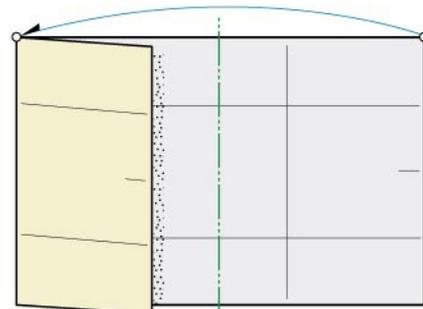

Eseguite prima le 2 piccole pieghe a valle centrali e poi le altre 2 longitudinali

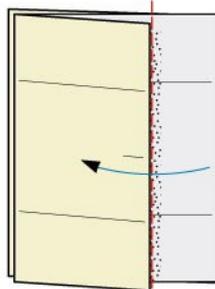

1 piega a valle verticale centrale

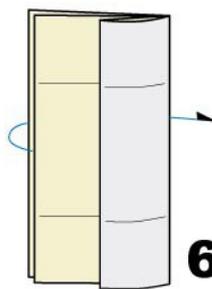

2 pieghe a valle e ruotate il bordo sinistro

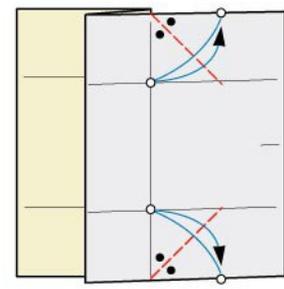

1 piega a monte e ruotate

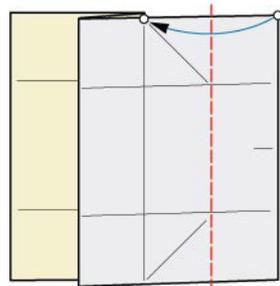

1 piega a valle e ruotate

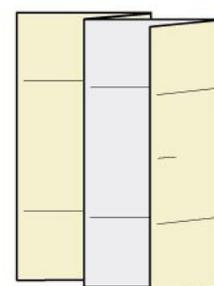

Ruotate il bordo sottostante

2 pieghe bisettrici a valle

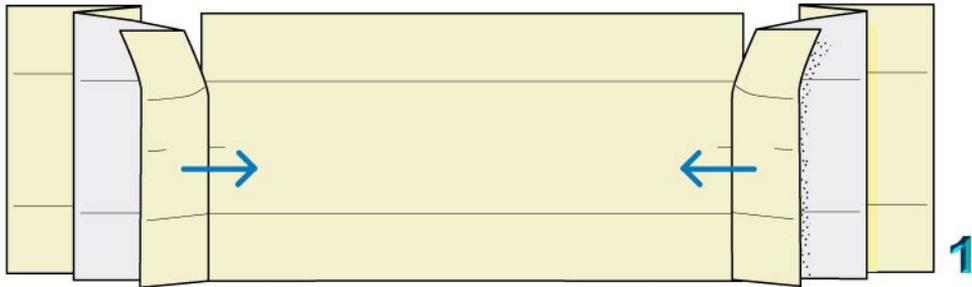

1 piega a valle e ruotate

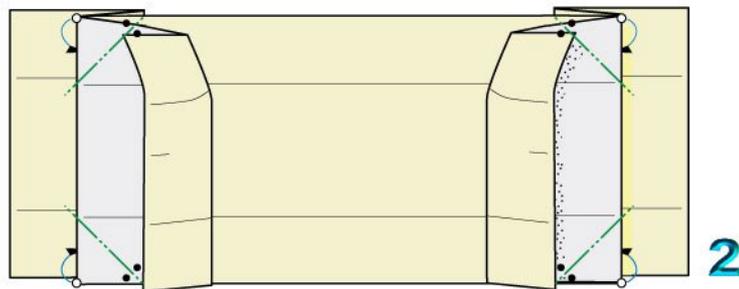

Piegate un altro modulo di testa

UNIONE DEI 2 MODULI DI TESTA CON QUELLO CENTRALE

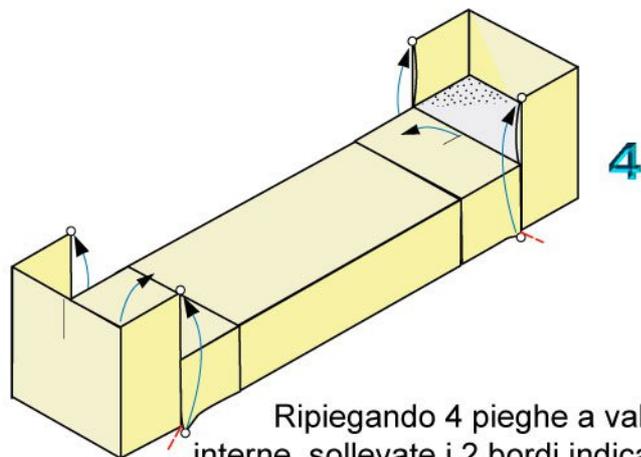

Intascate il modulo centrale nei 2 moduli di testa

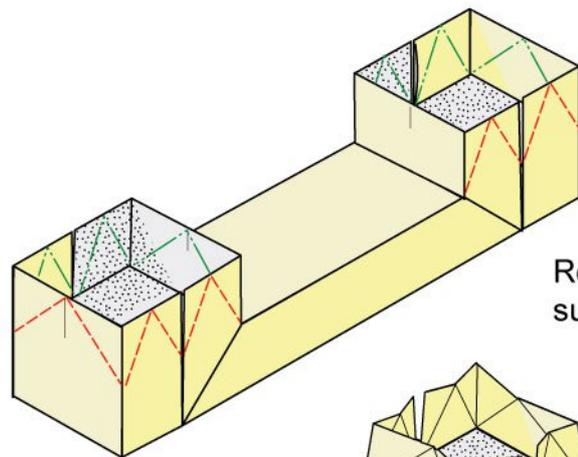

4 pieghe bisettrici a monte e ruotate bloccando il tutto

Ripiegando a valle ed a monte modellate 3D

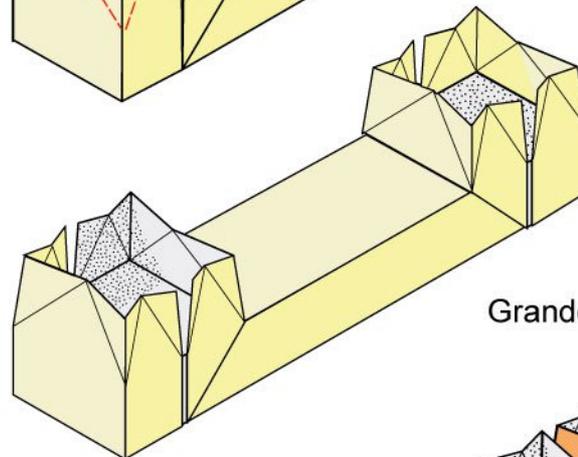

Ripiegando 4 pieghe a valle interne, sollevate i 2 bordi indicati

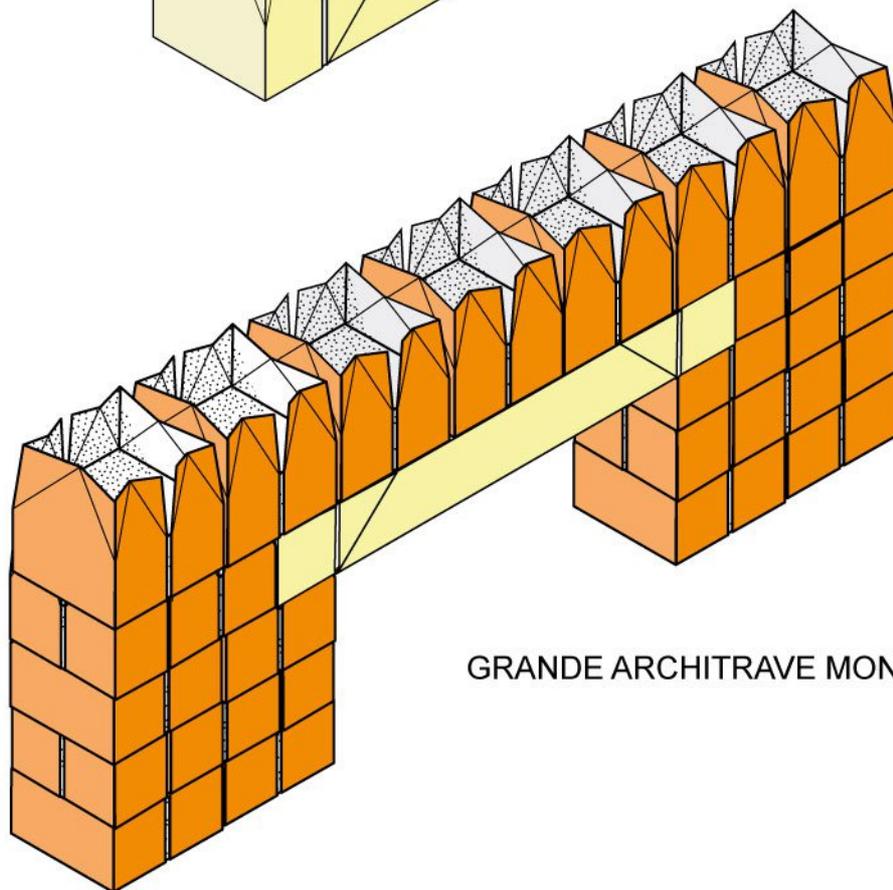

5

Restringete i perimetri superiori

6

Grande architrave ultimato

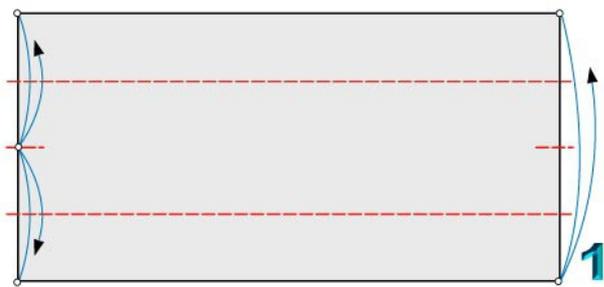

GRANDE ARCHITRAVE MONTATO

SIMPLIFIED ROOFTOP

This is a method to build a large structure in a very simple way.

As a result, we get a sufficiently rigid and resistant panel, joining several of them you can create a roof or a large floor plate.

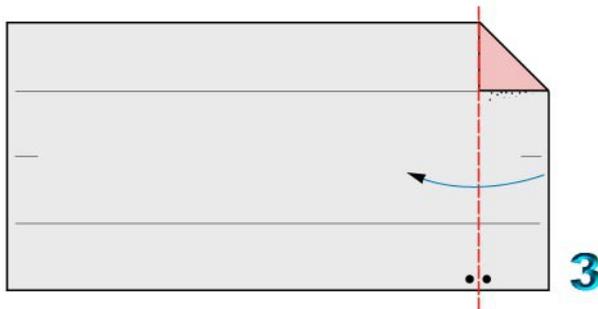

COSTRUZIONE DI UN MODULO

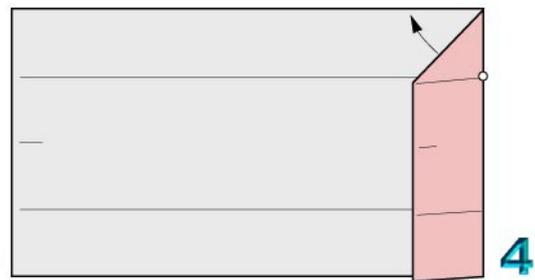

Eseguite prima le 2 piccole pieghe a valle centrali e poi le altre 2 longitudinali

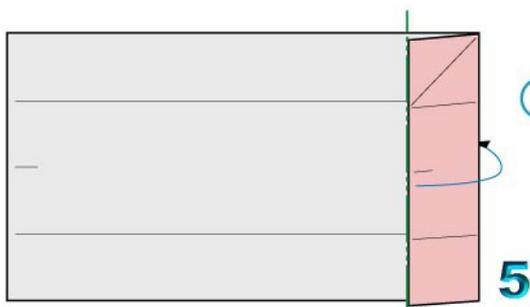

1 piega a bisettrice a valle e ruotate

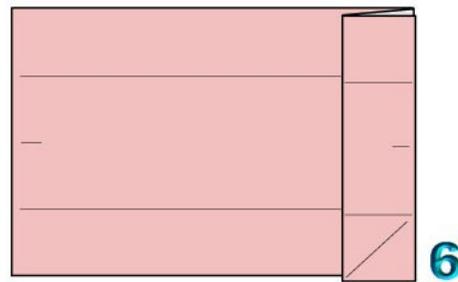

1 piega a valle e ruotate

Estraete il triangolo interno

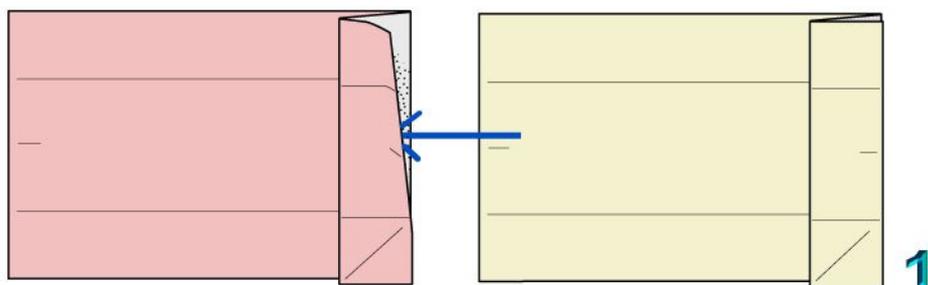

1 piega a monte, ruotate e ribaltate

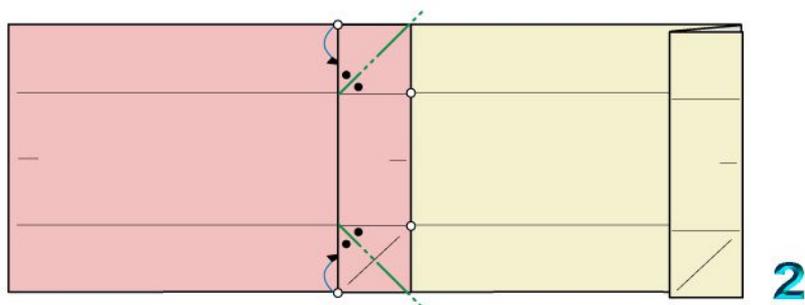

modulo ultimato

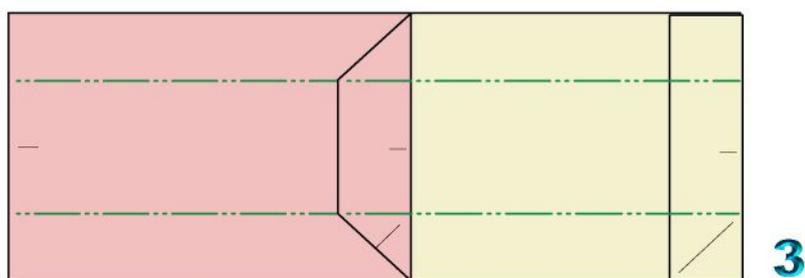

UNIONE DEI MODULI PER REALIZZARE UN PANNELLO SOLAIO O TETTO

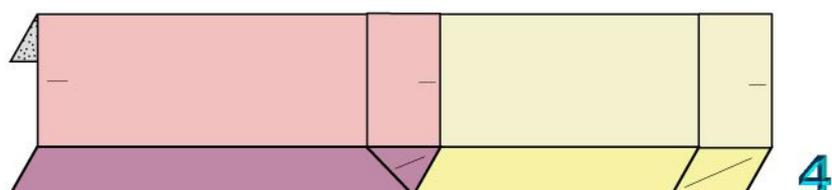

Intascate un modulo nell'altro

2 pieghe bisettrici a monte e ruotate bloccando l'unione

Ripiegando a monte modellate 3D

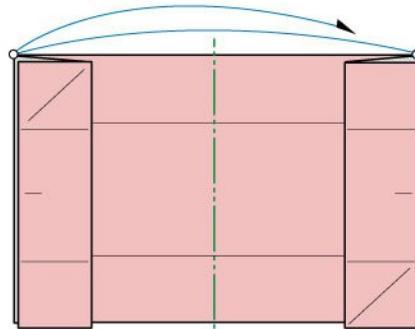

Unione di 2 moduli ultimata

COSTRUZIONE DI UN MODULO COLMO DI UN TETTO

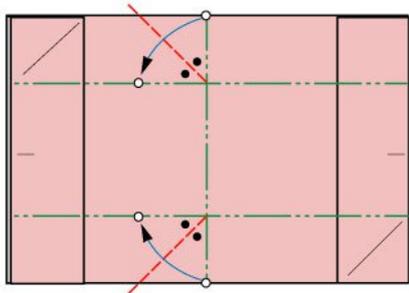

1

Partite dal modulo base e realizzate una tasca anche all'altra estremità

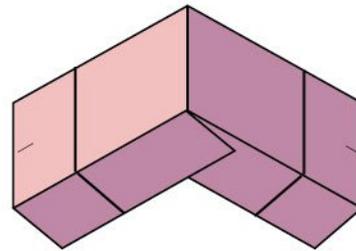

2

1 piega a monte e ruotate

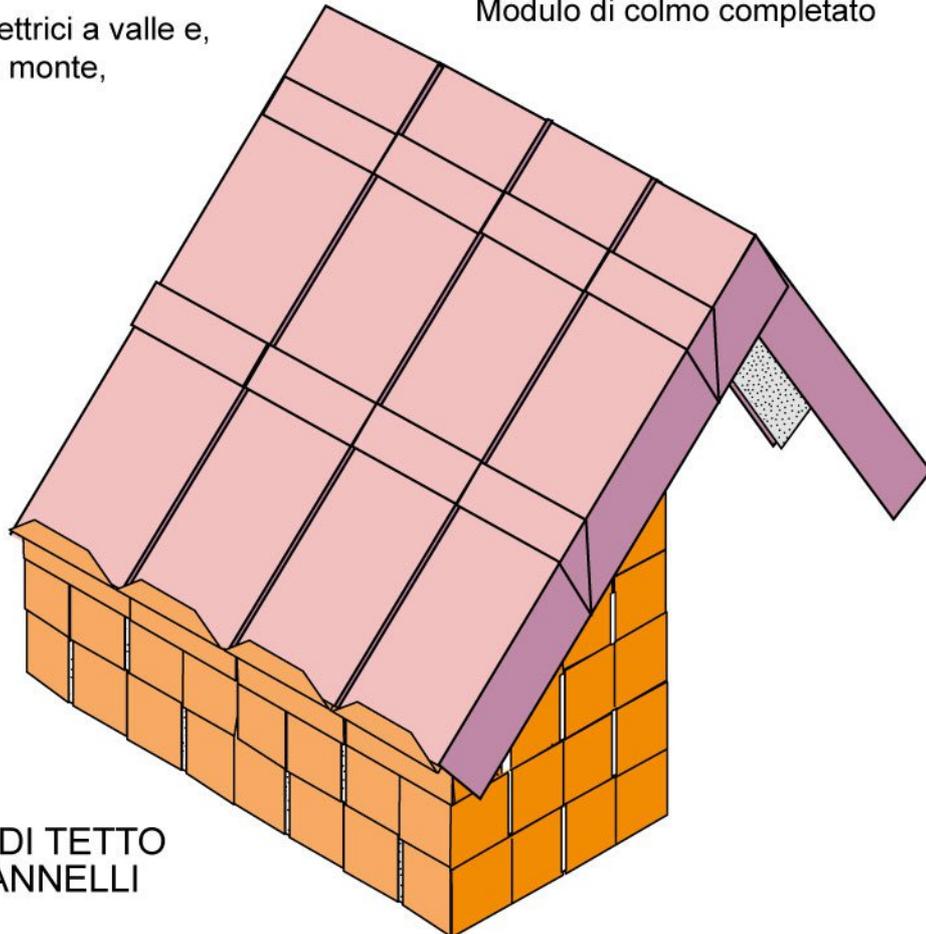

3

2 pieghe bisettrici a valle e, ripiegando a monte, ruotate 3D

4

Modulo di colmo completato

ESEMPIO DI TETTO
CON 4 PANNELLI

PROSPETTO SUD

PROSPETTO OVEST

PROSPETTO EST

PROSPETTO NORD

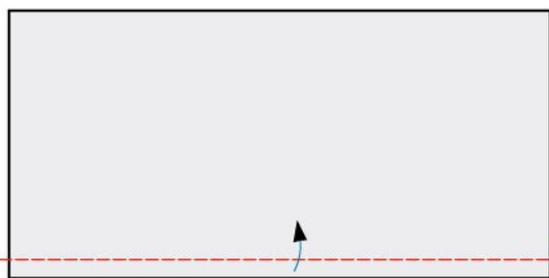

COLUMN

The column is a key architectural element of classical architecture used until a century ago in the construction of churches, mansions, and palaces. It consists of three elements: base, shaft, and capital.

One square sheet and three rectangular ones are needed for the shaft of the column.

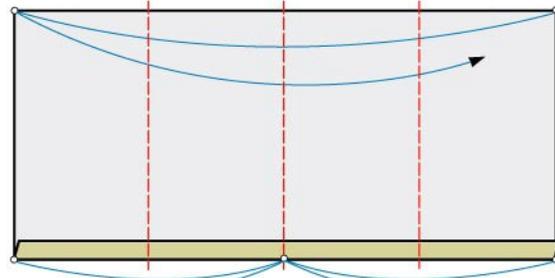

COSTRUZIONE DELLA BASE

Con un foglio rettangolare si costruisce uno scheletro centrale da incastrare in un modulo A1, precedentemente preparato

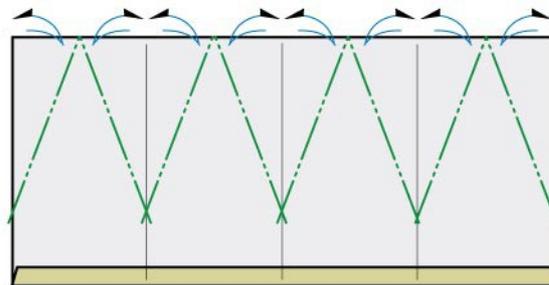

1

1 piega a valle e ruotate

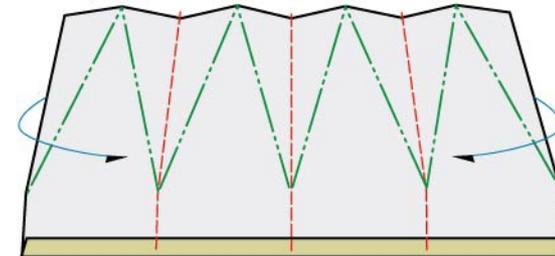

2

Eseguite prima la piega a valle centrale e poi le altre 2 trasversali

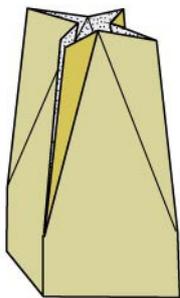

3

Eseguite 8 pieghe a monte in successione

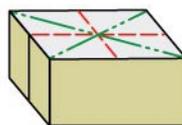

4

Ripiegando a valle ed a monte ruotate 3D

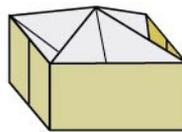

5

Questa specie di piramide, che farà da scheletro alla colonna, deve essere inserita in un modulo A1 modificato

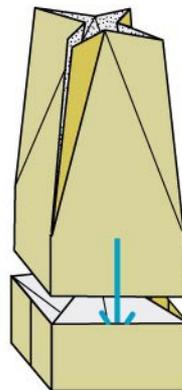

1

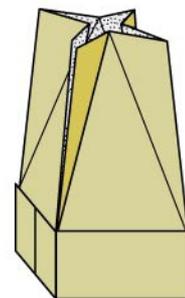

2

Prendete un modulo A1 e, mediante 2 pieghe a valle e 2 a monte sollevatene il centro

3

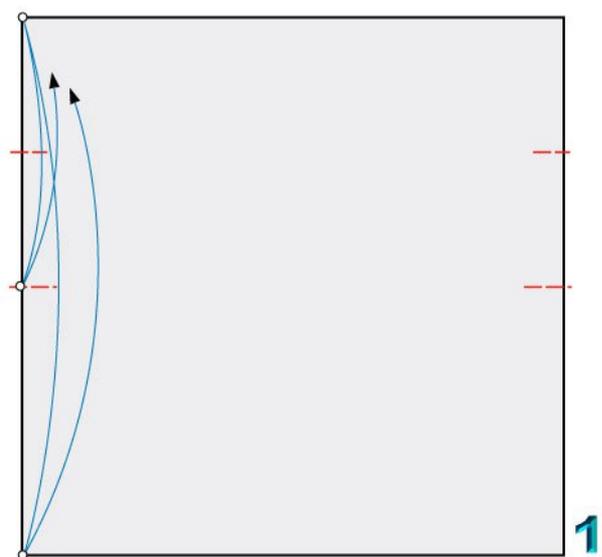

Inserite la specie di piramide nel modulo A1 modificato

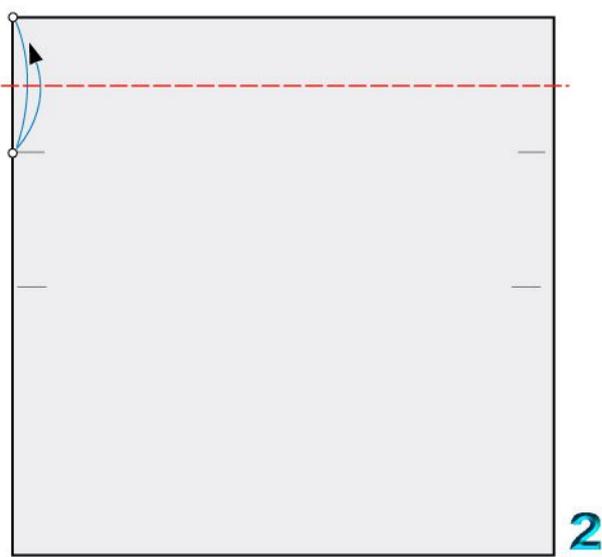

4

BASE della colonna ultimata

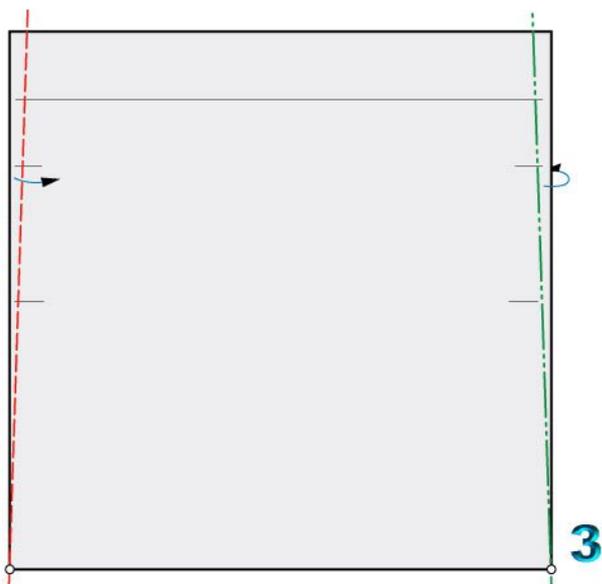

COSTRUZIONE DEL FUSTO

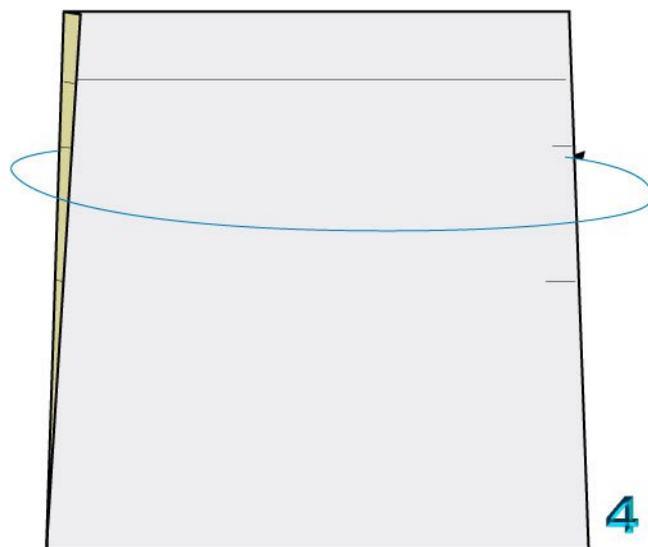

4 piccole a valle partendo da quelle centrali

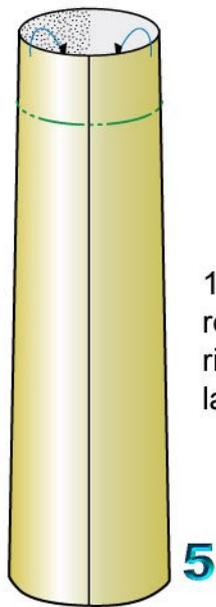

1 piega a valle

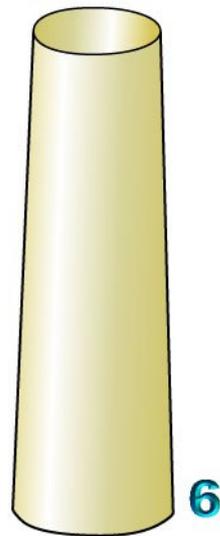

1 piega a valle ed una a monte

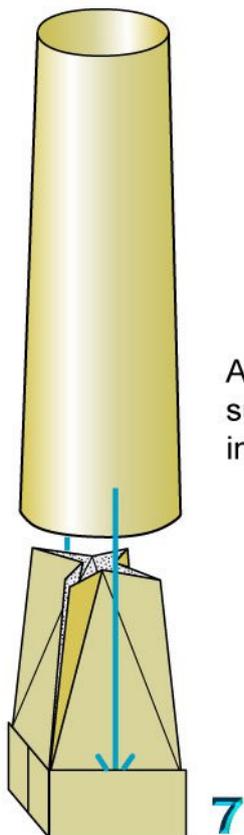

Ruotate agganciando

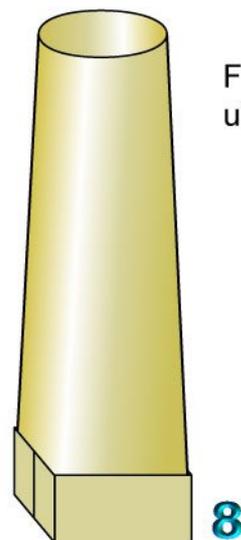

1 piega a monte,
rovesciate all'interno e
ribaltate per nascondere
la giunzione

Fusto ultimato

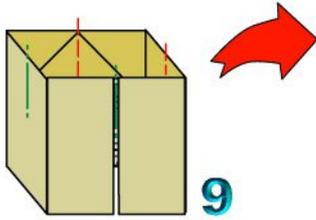

Avvolgendo il fusto
sullo scheletro
inserirlo nella base

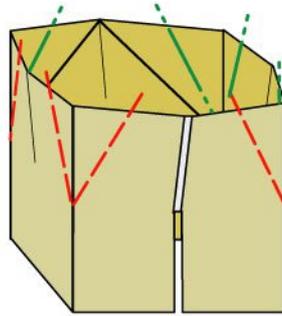

Fusto più basamento
ultimati

COSTRUZIONE DEL CAPITELLO

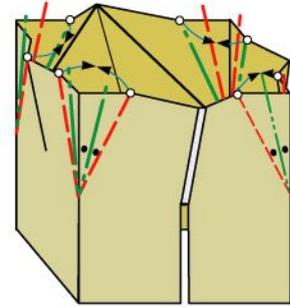

9

Partite da un modulo "A" rovesciato. Eseguite 1 piccola piega a monte al centro di ogni lato.

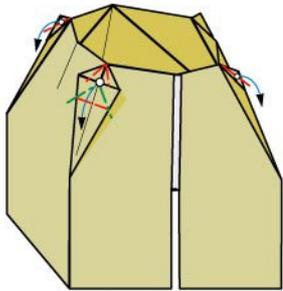

10

8 pieghe a valle, 2 per lato

11

8 pieghe bisettrici a monte, 2 per lato e ruotate ripiegando a valle.

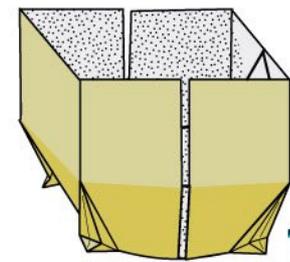

12

3 piccole pieghe a valle e 2 a monte per spigolo e ruotate

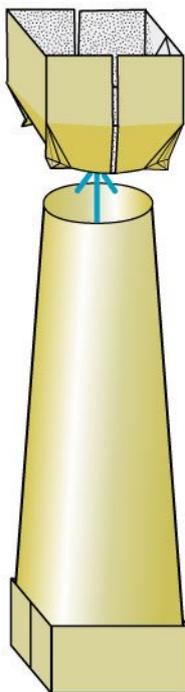

13

Ribaltate

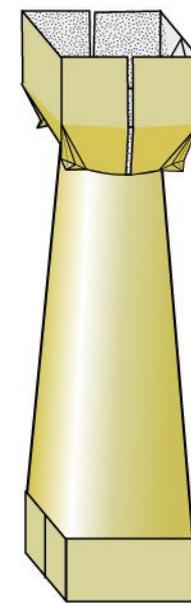

14

Capitello ultimato

Inserite il fusto con base nel capitello

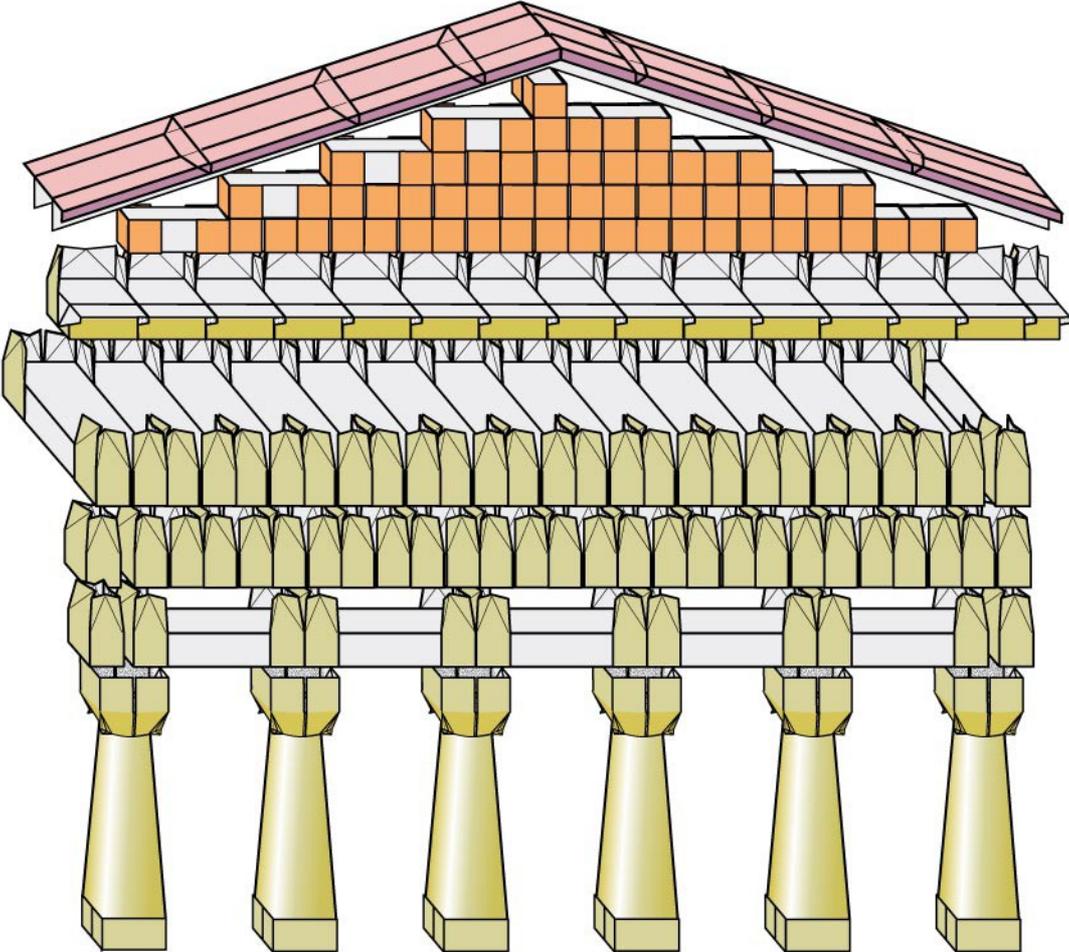

15

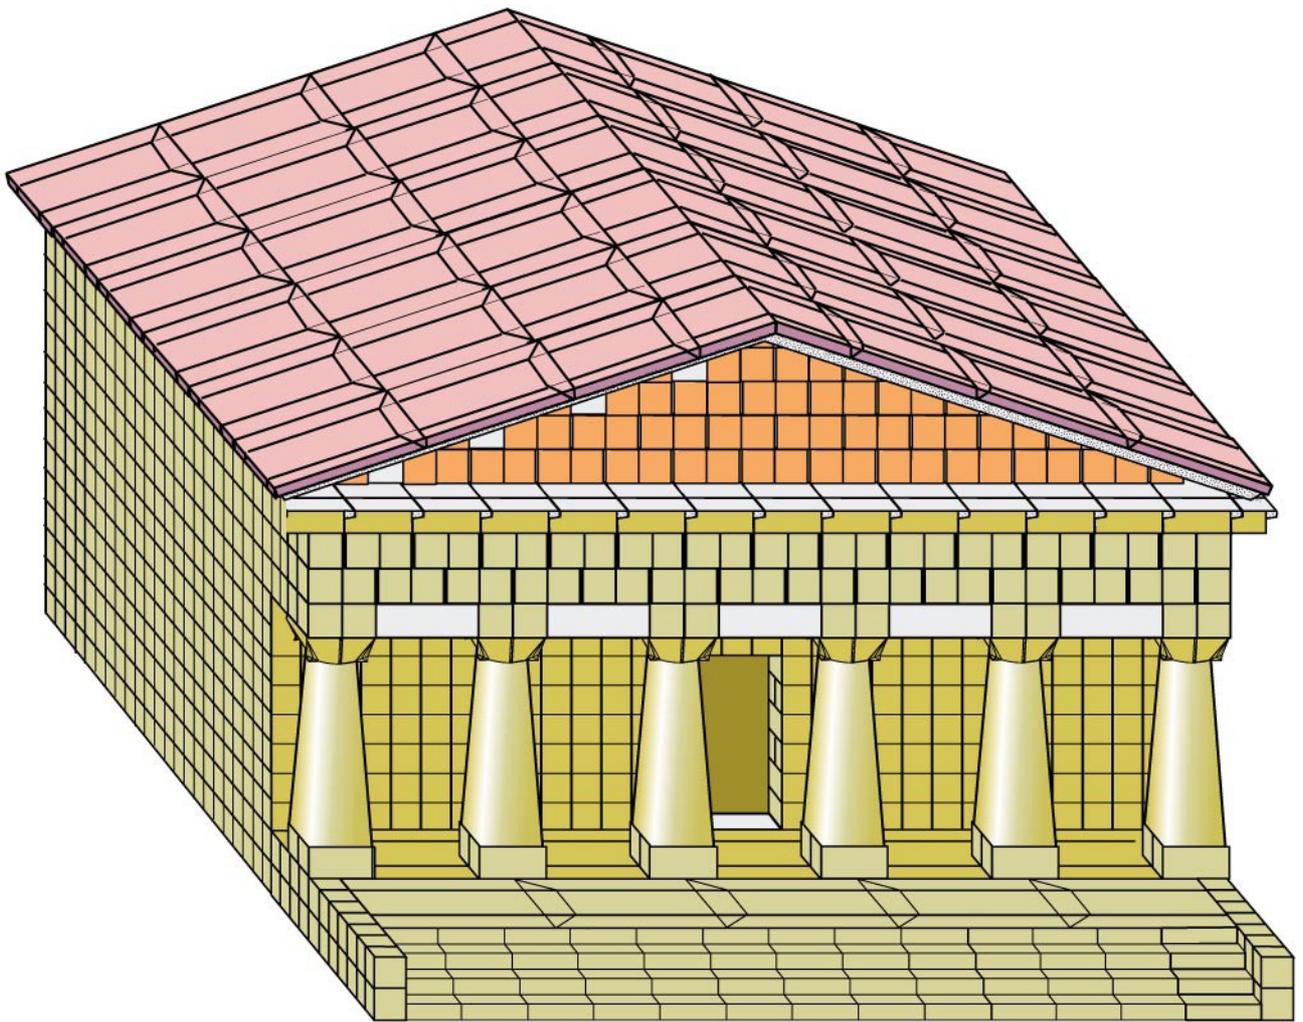

Colonna simil-corinzia ultimata

16

CONSTRUCTION OF A HEXASTYLE CORINTHIAN ROMAN TEMPLE - DISTYLE IN ANTIS

Roman temples differ from those of the ancient Greek by having steps on the front side only

CURVED WALLS

The circular towers gradually replace the square towers in response to the improvement of guns (XIV century).

In fact, a circular wall, though more difficult to build, provides increased resistance to battering rams and cannon balls and they can also deflect the shots that hit the target.

In civil architecture circular roofed spaces called exedras were incorporated by the Romans in their basilicas, which were public and court buildings.

Later exedras were used in the apses and the chapels of Romanesque churches.

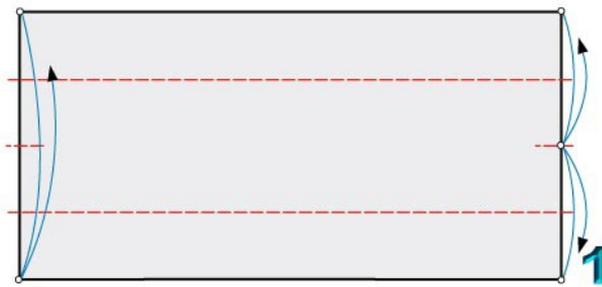

The argument is developed in the chapters: -Curved bloch
-Curved half bloch
-Guards' wall walk

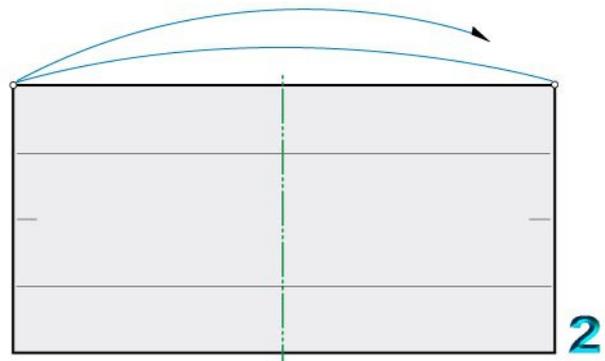

D1 - CURVED BLOCK

By modifying the basic block you get a block which is suitable to build circular towers or apses of churches. In the first case, it is also necessary to modify the guards' wall walk, in the second case it is necessary to develop an adequate system of coverage.

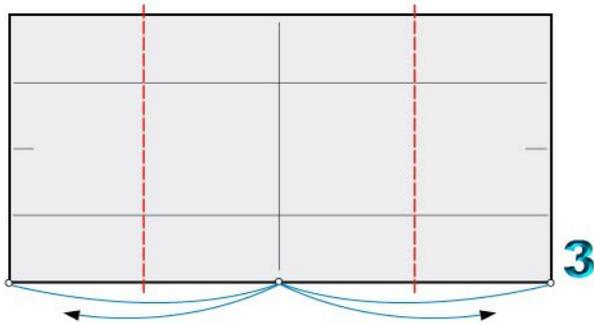

COSTRUZIONE DEL BLOCCO CURVO

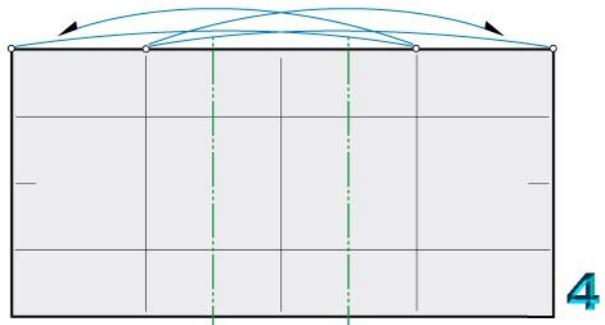

Eseguite prima le 2 piccole pieghe a valle centrali e poi le altre 2 longitudinali

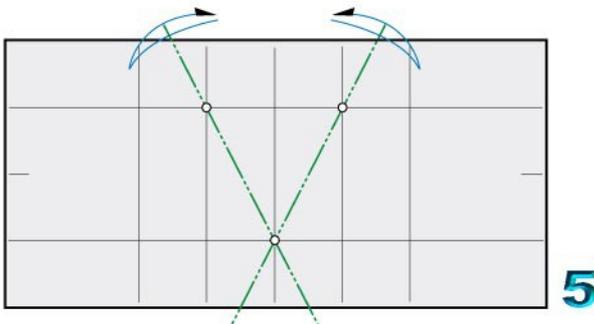

1 piega a monte

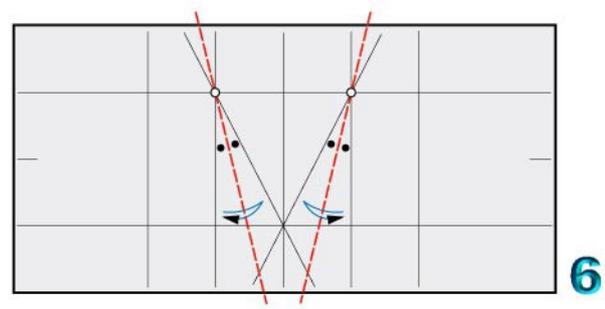

2 pieghe a valle

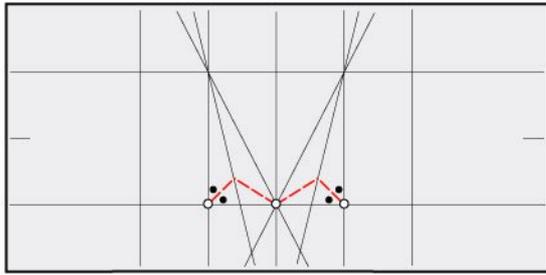

2 pieghe a monte

2 pieghe a monte. Queste, e quelle dei passaggi n. 6 e 7 costituiscono delle pre-piegature per condizionare la compattazione della carta di cui alla fig, n.17

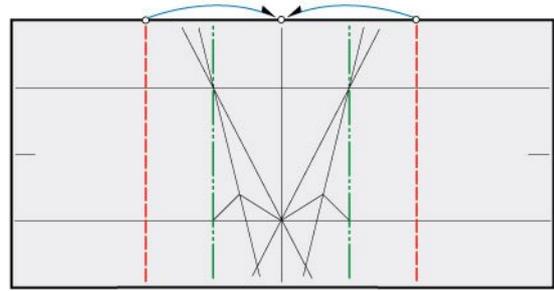

2 pieghe bisettrici a valle

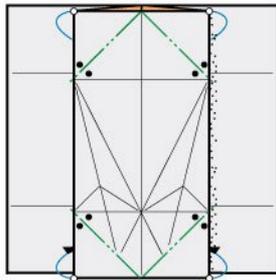

7

4 piccole pieghe a valle

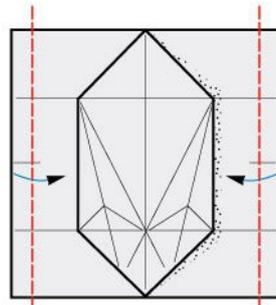

8

Ruotate ripiegando a valle ed a monte

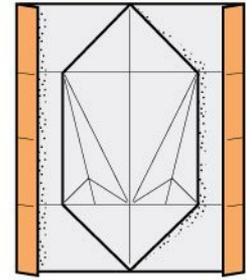

9

4 pieghe a monte e ruotate

10

2 pieghe a valle e ruotate

Ribaltate

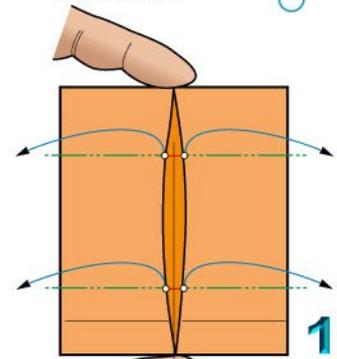

12

1 piega a valle

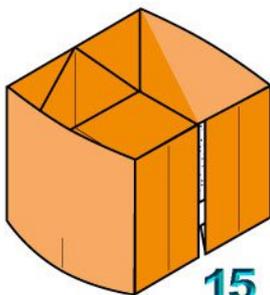

13

Ripiegate 2 volte a monte

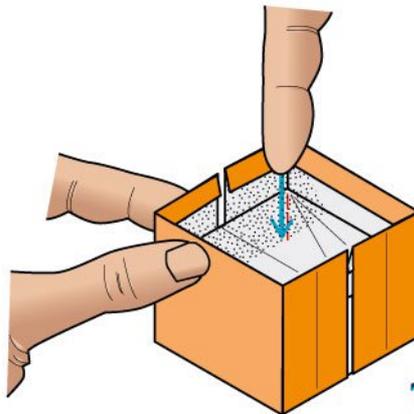

14

Ripiegando e comprimendo contemporaneamente, aprite modellando 3D

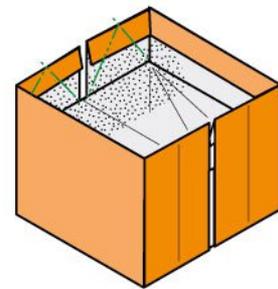

15

Ribaltate

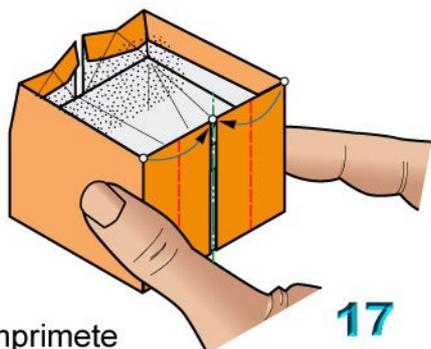

16

Comprimete gli spigoli e fate rientrare leggermente il fondo

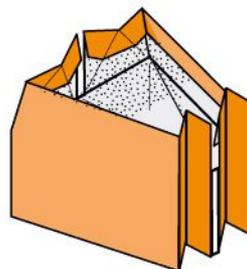

4 pieghe a monte

Comprimete
ripiegando a valle 2 volte

17

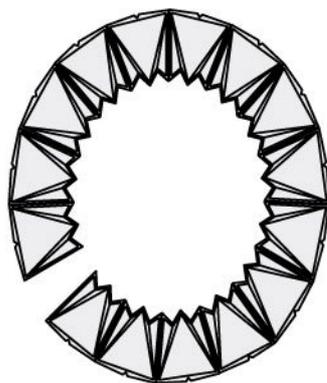

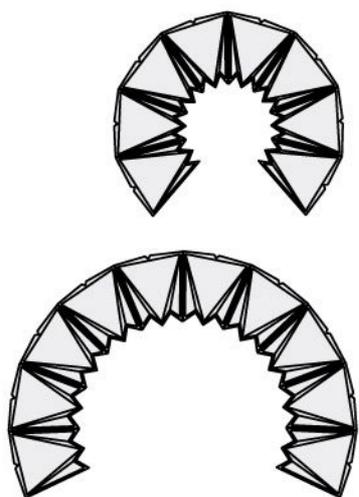

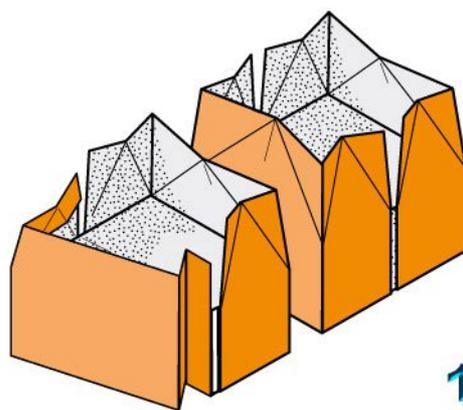

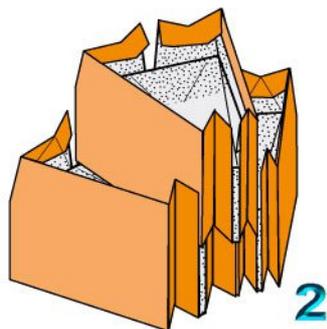

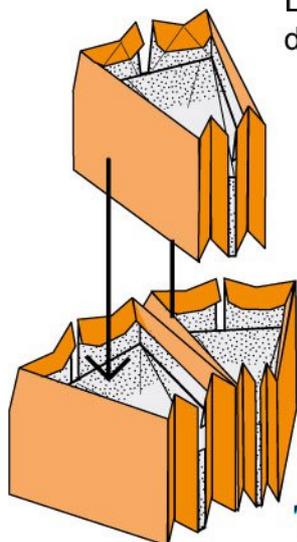

18

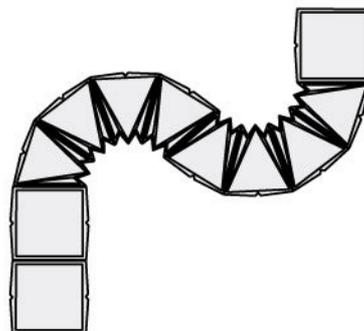

Blocco curvo ultimato

ESEMPIO DI UNIONE DI 3 BLOCCHI CURVI

L'incastro avviene in modo analogo a quello
dei blocchi "A"

Per eseguire un raccordo tra
un muro dritto ed uno curvo
modificate il blocco "A" solo
nella metà a contatto con
quest'ultimo

Variando la compressione del blocco si agisce sull'angolo formato dai fianchi; in questo modo si possono ottenere muri tondi, ellissoidali, raccordi con il blocco base "A" ecc.

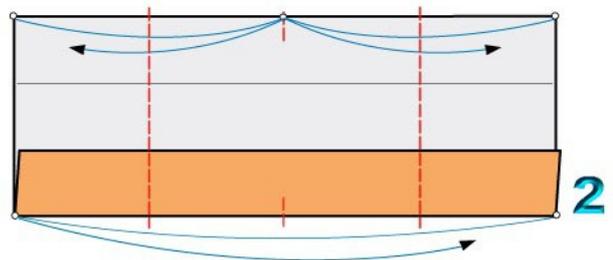

D2 - HALF SIZE CURVED BLOCK

This block is mainly used to build head walls or fenestrations.

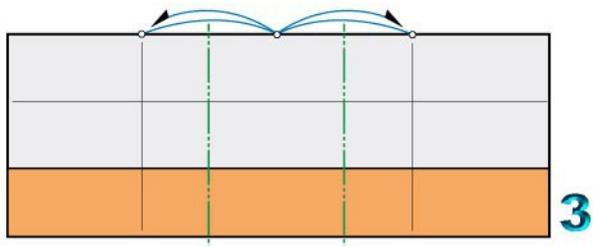

After reducing the width of the initial rectangle, the construction is similar to that of block A.

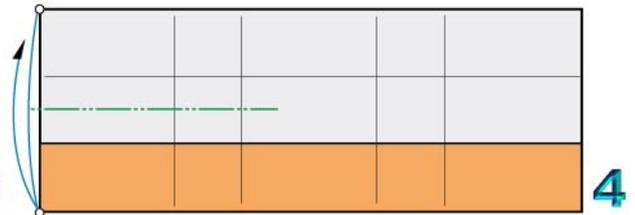

3 pieghe a valle e ruotate il bordo inferiore

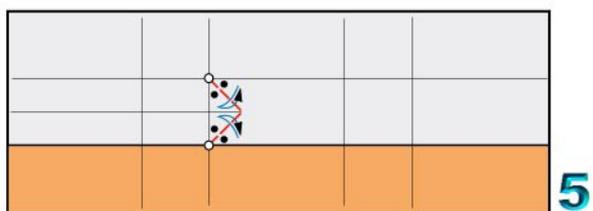

Eseguite prima le 2 piccole pieghe a valle centrali e poi le altre 2 trasversali

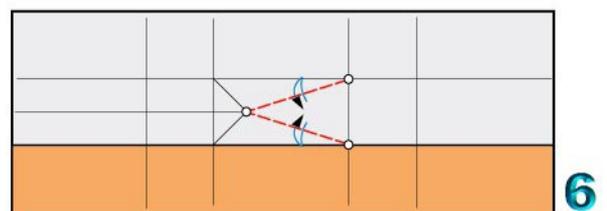

2 pieghe a monte

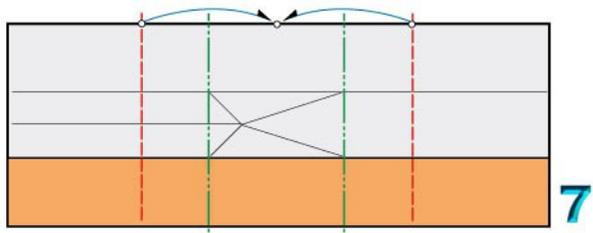

1 piega a monte

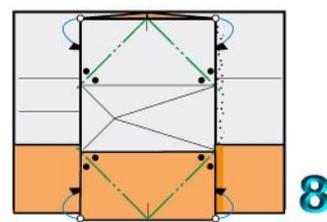

2 piccole pieghe bisettrici a valle

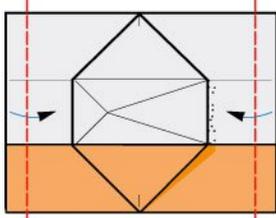

2 pieghe a valle

Ruotate ripiegando a valle ed a monte

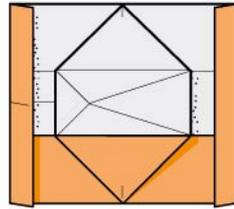

4 pieghe bisettrici a monte e ruotate

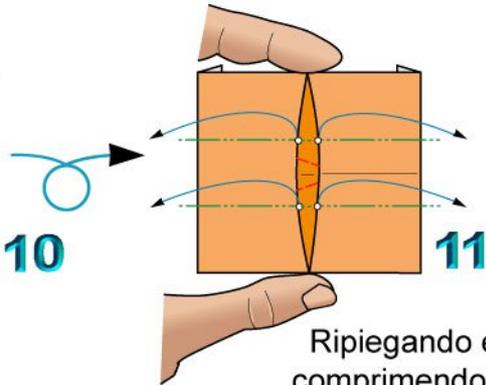

9

2 pieghe a valle e ruotate

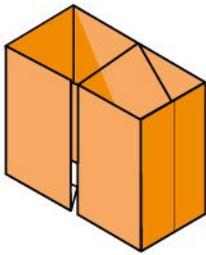

10

Ribaltate

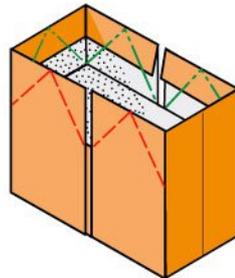

11

Ripiegando e comprimendo contemporaneamente, aprite modellando 3D

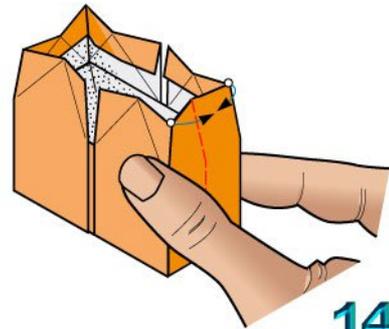

12

Ribaltate

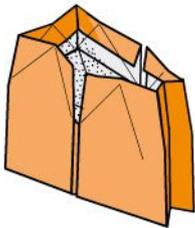

13

Diminuite il perimetro del bordo superiore

14

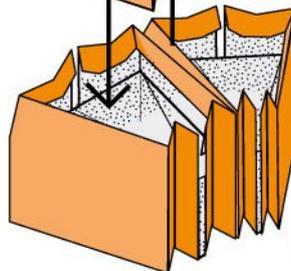

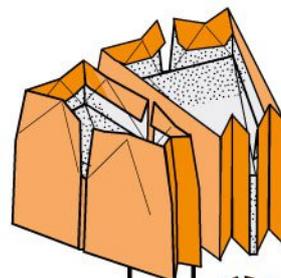

Comprimete

3

CONTEMPORARY ARCHITECTURE

Contemporary architecture is structurally and substantially different from the classical and gothic one which is based on arches and domes supported by solid brick or stone walls.

Modern architecture is generally based on reinforced concrete and steel forming light structures with architraves so that the walls have lost their original function of load bearing, to such an extent that dividing walls can even be made of glass.

Concrete is a composite material made of two components: aggregate (sand and gravel) bonded with wet cement that hardens over time.

The Romans used pozzolanic ash as a binder. Nowadays cement is a mixture of limestone and clay baked in kilns at high temperatures to form quicklime (CaO) and ground into a powder.

The aggregate, gravel, chipping and river sand, prevents the mixture from shrinking when the concrete dries up and hardens.

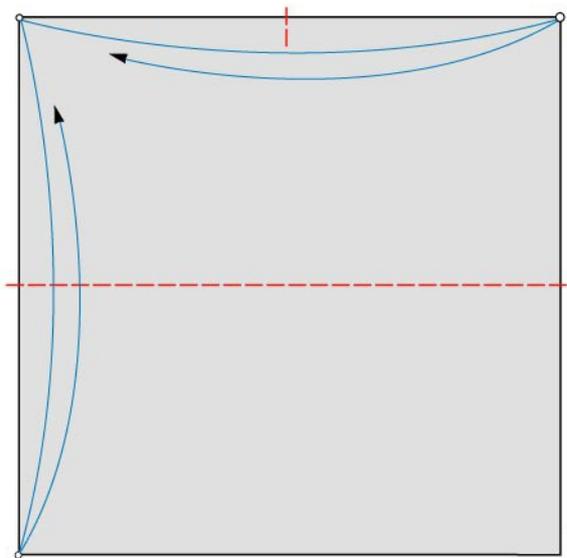

Steel bars or steel mesh are placed inside moulds before the fluid concrete is poured onto them to dry into rock-solid beams and pilasters, all "moored" to each other in a skeleton of columns and beams called "concrete frame".

Steel is used also to erect flat or spatial structures such as pylons and cantilevered bridges.

In the next pages, we will make origami buildings using contemporary construction techniques, so we are not going to use blocks to build walls but we will construct skeletons made of columns and beams where light dividing walls can be inserted to close and delimit spaces.

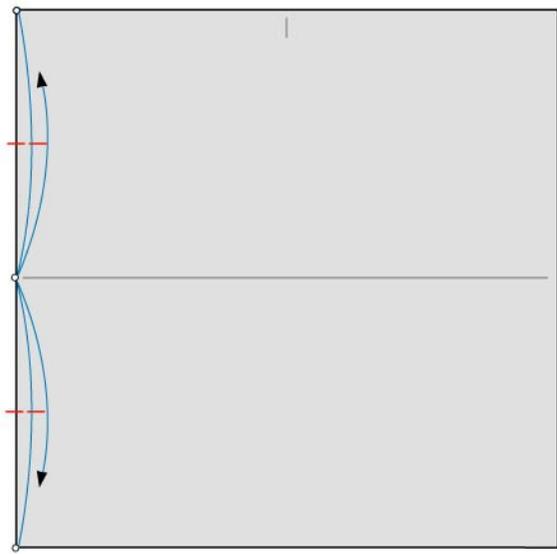

RECTANGULAR BASE PILASTER

To build this pilaster you must use strong paper or light cardboard. For the villa in the picture, I have used 8x8 cm square sheets.

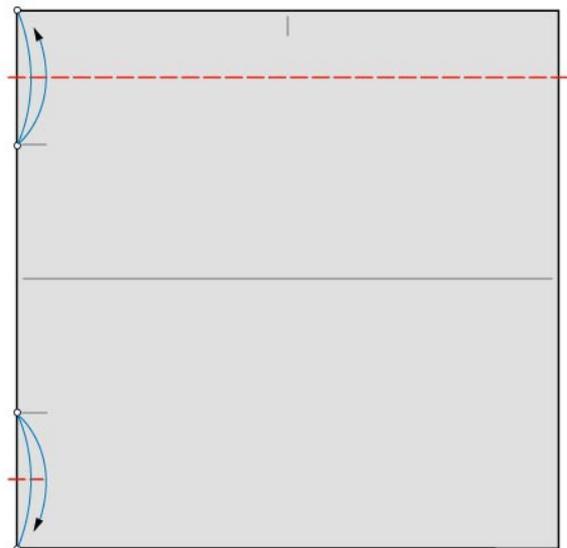

1

1 piega a valle orizzontale ed
1 piccola verticale

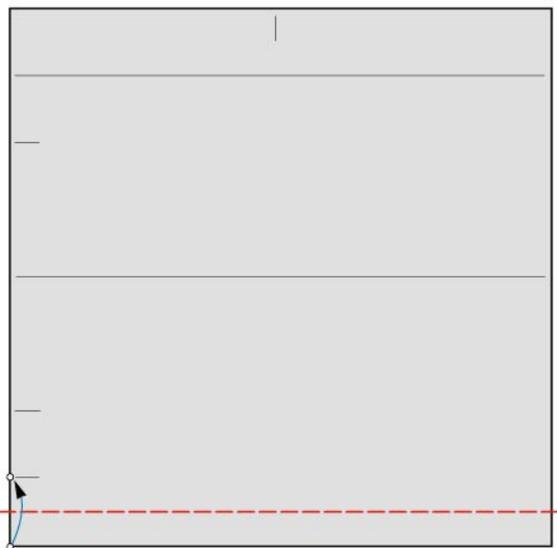

2

2 piccole pieghe a valle orizzontali

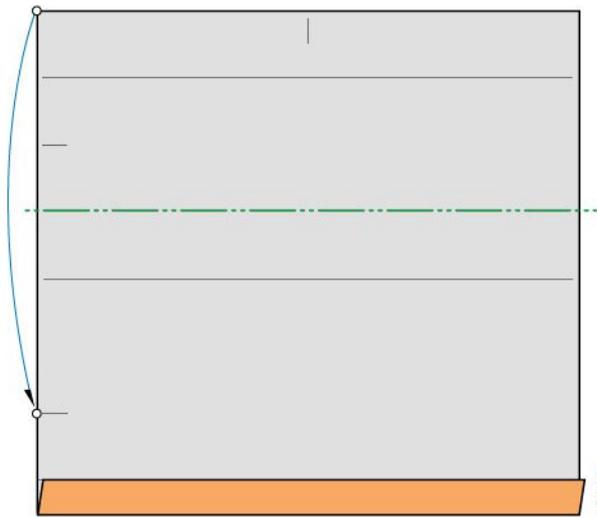

3

2 pieghe a valle orizzontali,
di cui 1 piccola

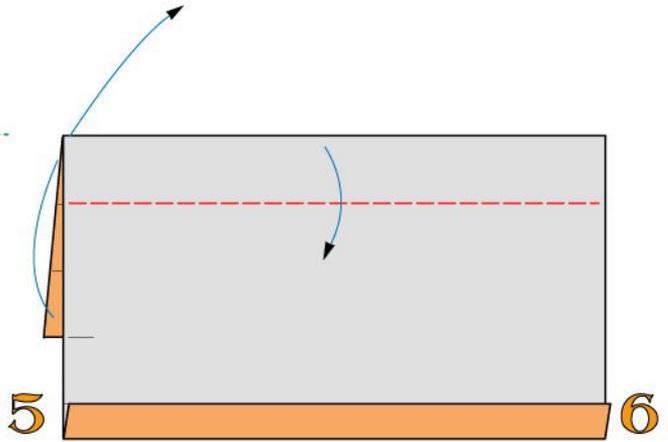

4

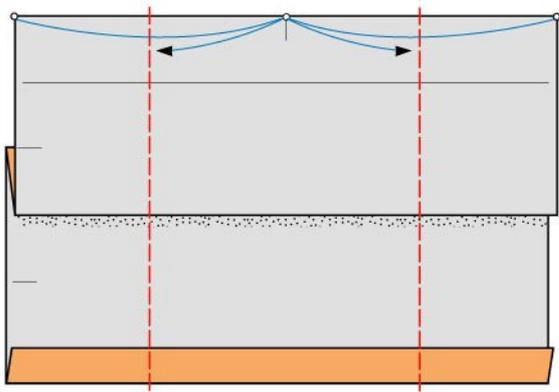

1 piega a valle orizzontale e ruotate

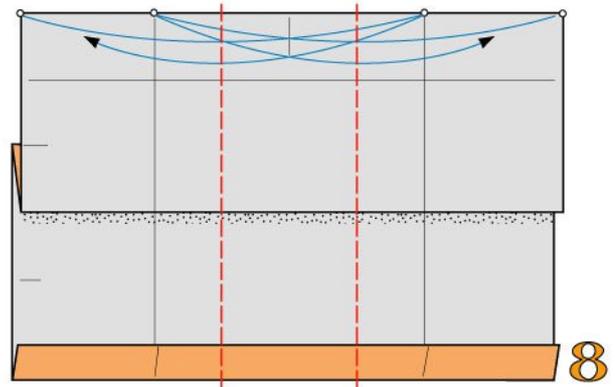

1 piega a monte orizzontale e ruotate

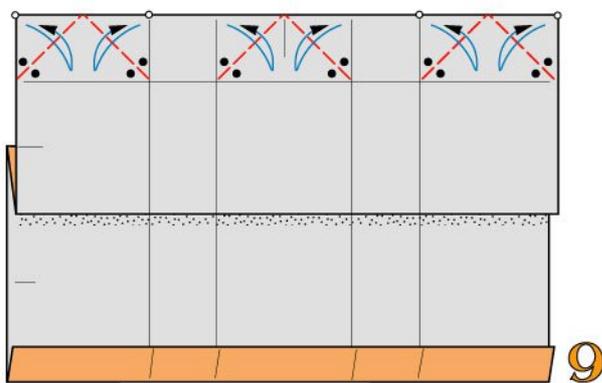

5 Ruotate ripiegando a valle

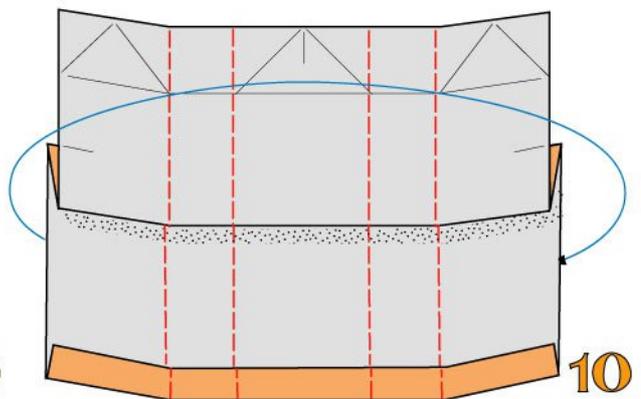

7 2 pieghe a valle

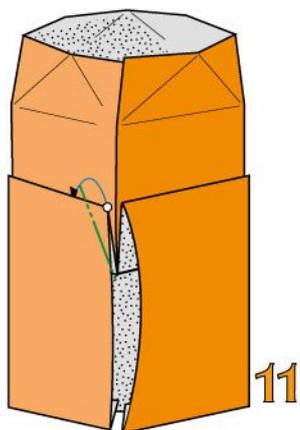

8 2 pieghe a valle

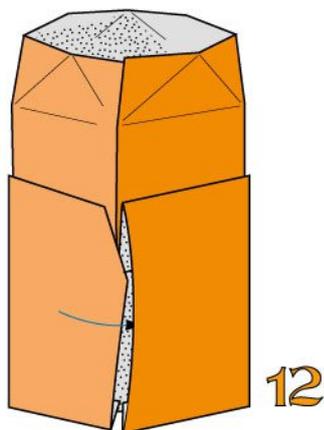

9 6 pieghe bisettrici a valle

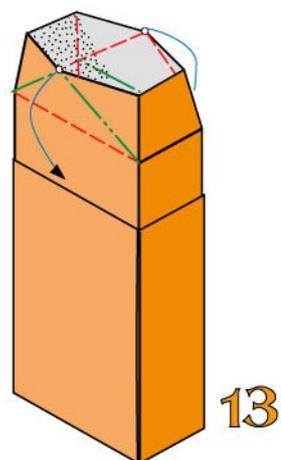

10 Chiudete 3D ripiegando a valle

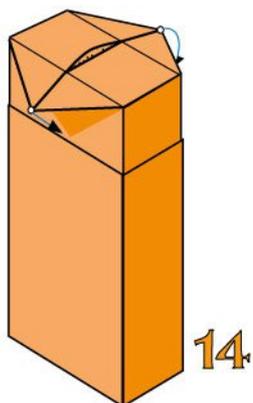

11
1 piega a monte e ruotate

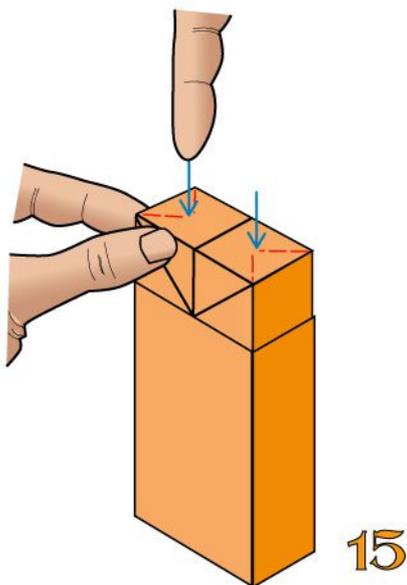

12
Intascate richiudendo completamente fino ad ottenere una sezione rettangolare

13
Ripiegando a valle ed a monte abbassate 2 vertici

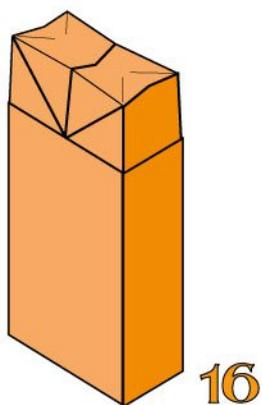

14

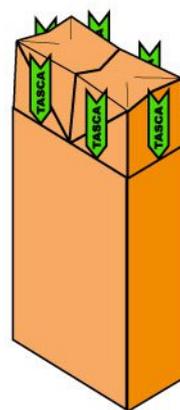

15

Comprimeo fate rientrare leggermente i quadrati superiori

16

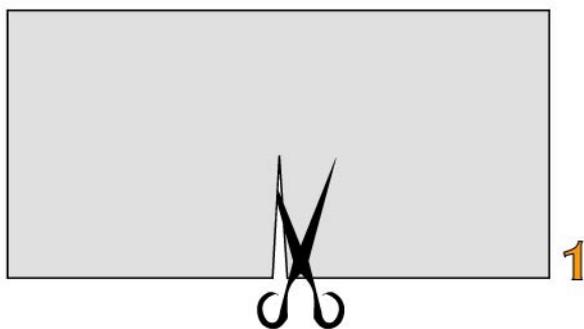

Pilastro rettangolare ultimato

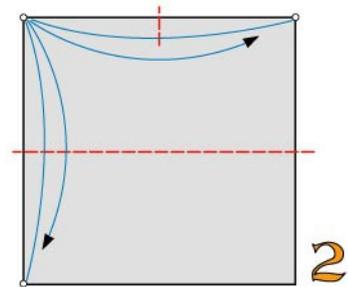

Sono utilizzabili 6 tasche per inserire travi e pareti

RECTANGULAR PILASTER TOP

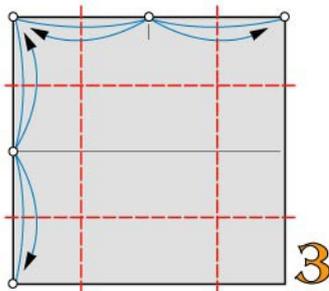

It is the element at the top of the pilaster.

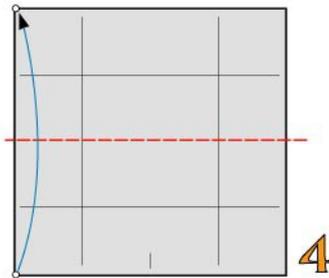

Piegate o dividete a metà un foglio rettangolare

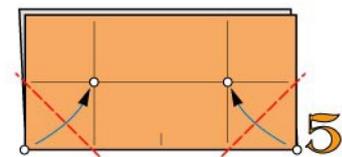

2 pieghe a valle

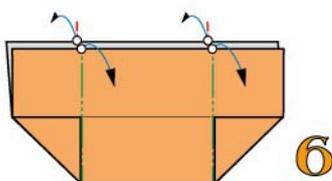

4 pieghe a valle

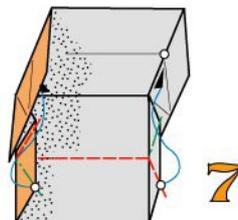

Ruotate ripiegando a valle

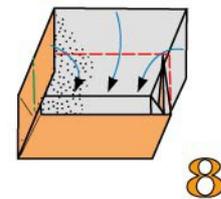

2 pieghe a valle e ruotate

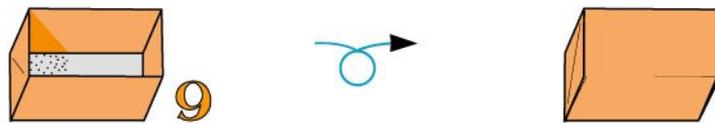

Ripiegando aprite 3D

2 pieghe a monte e richiudete 3D

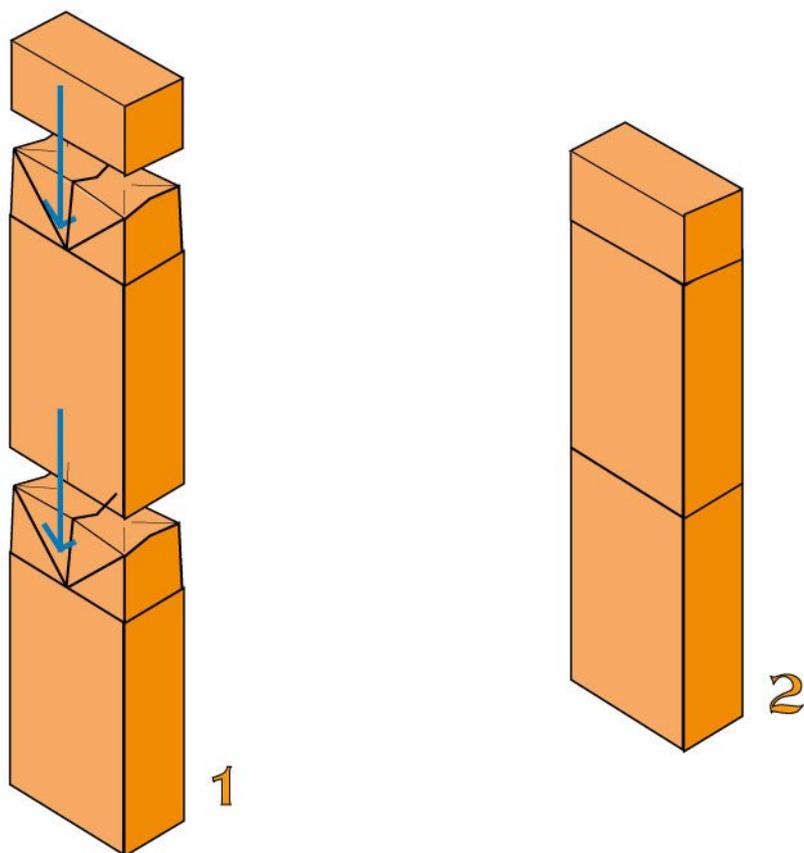

Rovesciate il bordo superiore

Cappuccio rettangolare ultimato

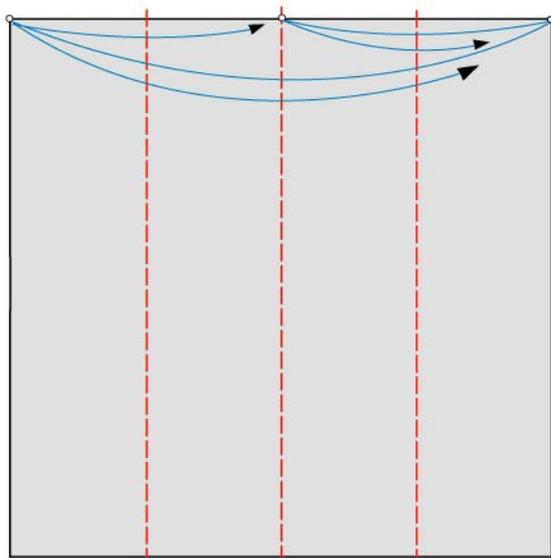

UNIONE DI 2 PILASTRI E CAPPuccio

2 pilastri si incastrano fra di loro dopo aver ancorato tutte le travi del piano

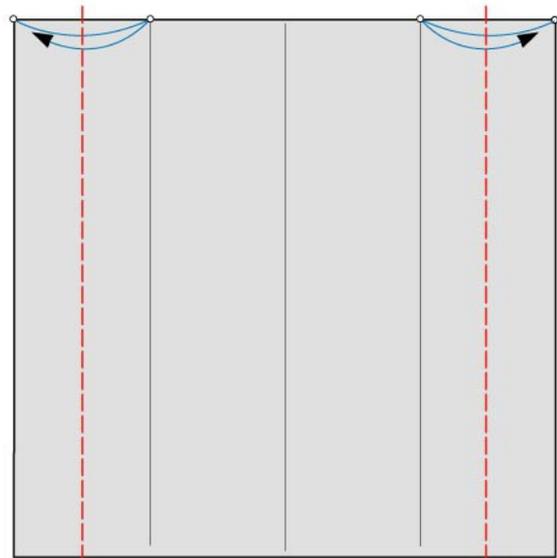

SQUARE BASE PILASTER

As for the previous one, heavy paper or cardboard has to be used.

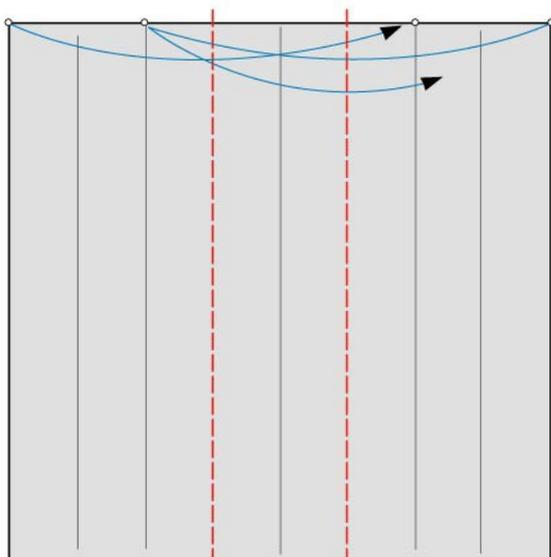

3 pieghe a valle

1

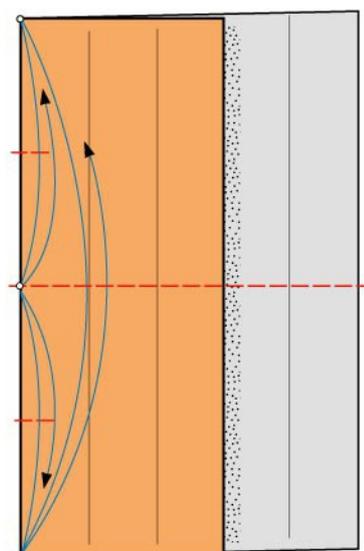

2 pieghe a valle

2

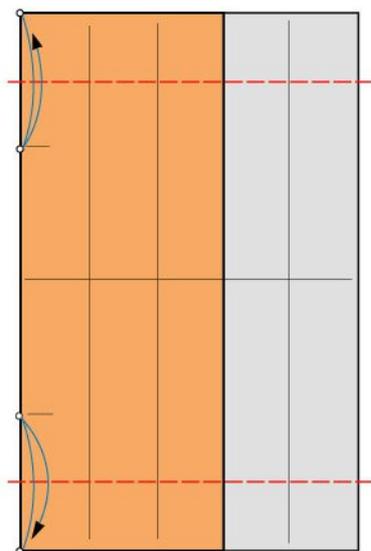

2 pieghe a valle e ruotate il bordo sinistro

3

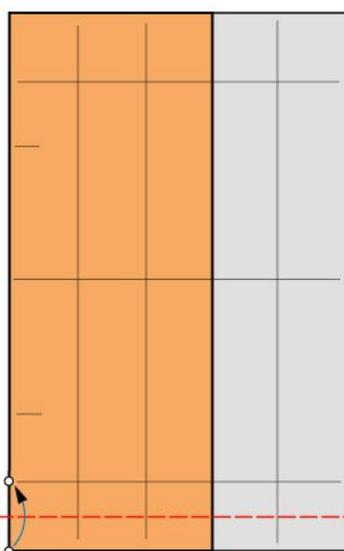

3 pieghe a valle

4

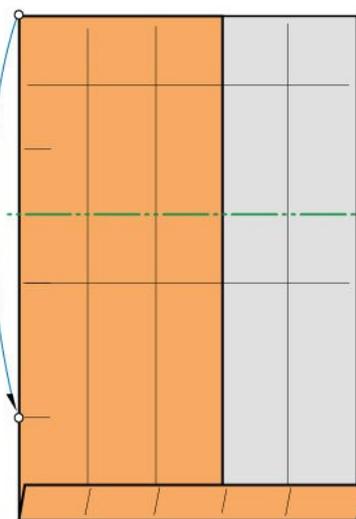

2 pieghe a valle

5

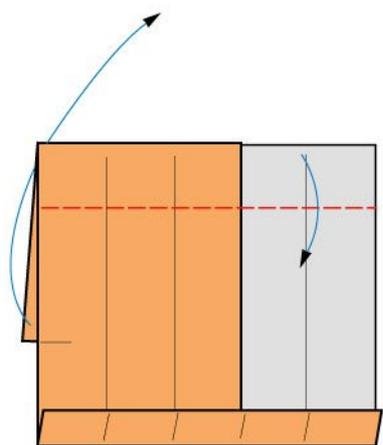

1 piega a valle e ruotate

6

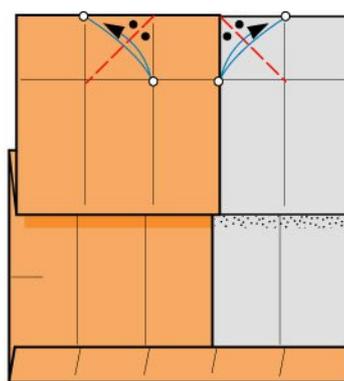

1 piega a monte e ruotate

7

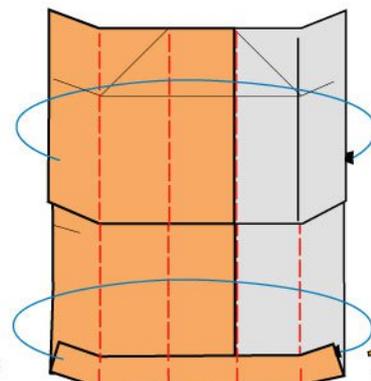

Ruotate ripiegando a valle

8

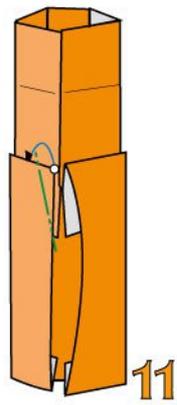

2 pieghe a valle

9

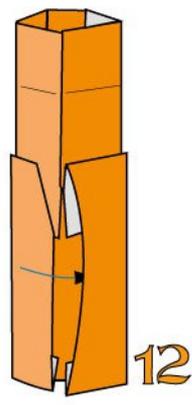

Chiudete 3D ripiegando a valle

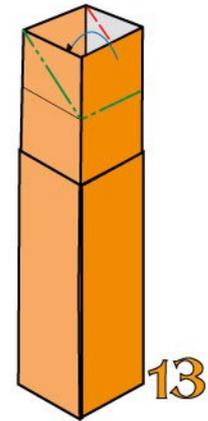

10

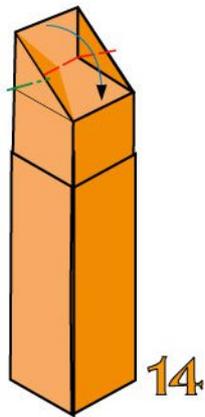

1 piega a monte e ruotate

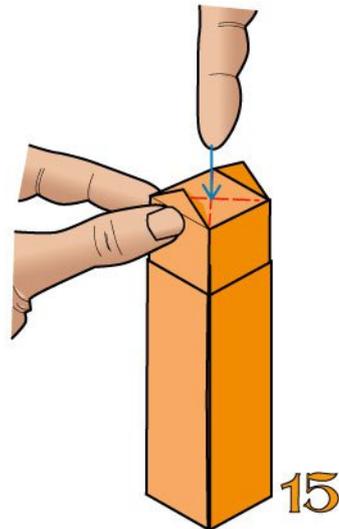

intascate

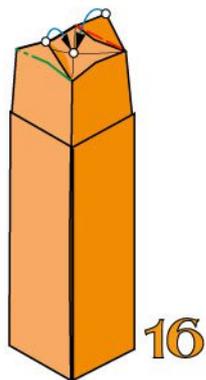

3 pieghe a monte e ruotate
abbassando il bordo indicato

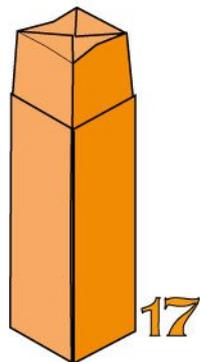

Abbassate anche il bordo opposto

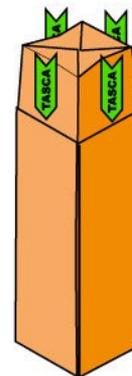

Comprimendo fate rientrare leggermente il centro

Abbassate i 2 vertici

FOUNDATIONS

These are not foundations in the strict sense of the word, but connections to keep in place the ground floor pilasters. They must be made after having built the first floor in order to adapt the beams to the skeleton frame given that they serve as a base to support it.

These connections are also equipped with flexible joints.

The basic elements of the foundations are three: wide foundation beams, flexible coupling, and narrow foundation beams. The words wide and narrow are here used to differentiate the beams that must join the longest and the shortest sides of the rectangular pilasters.

TRAVE DI FONDAZIONE LARGA

2 piccole pieghe a valle

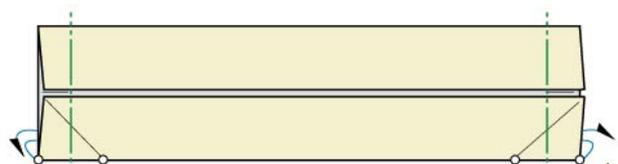

2 pieghe bisettrici a valle

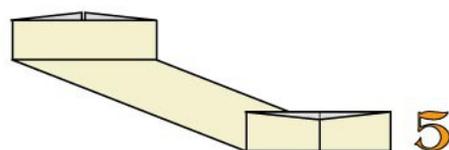

2 pieghe a valle e ruotate

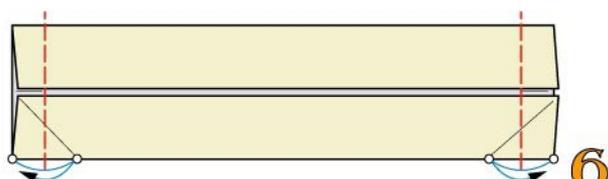

A questo punto ci sono 2 possibilità: nel caso non ci siano pareti soprastanti, cioè nel caso ci sia un porticato vuoto, la fondazione si monta con l'apertura verso il basso, secondo le figure 4 e 5; Se invece bisogna fissare delle pareti, si piega con l'apertura in alto, per avere una tasca disponibile per l'incastro, vedi figure 6 e 7.

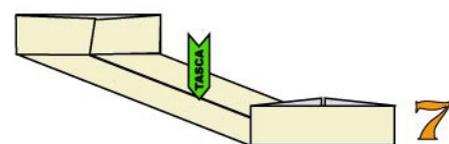

2 pieghe a monte e ruotate 3D

Fondazione larga per portico ultimata

2 pieghe a valle e ruotate 3D

Fondazione larga per parete ultimata

FLEXIBLE JOINT

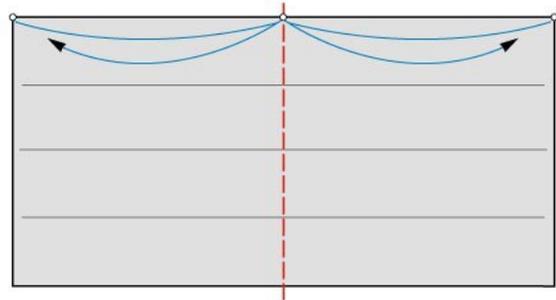

I thought it necessary to study a system for connecting the dimensionally flexible pillar base, since the frame dimensions cannot be determined.

The use of this joint allows the foundation to adapt dimensionally to each span of the frame.

10

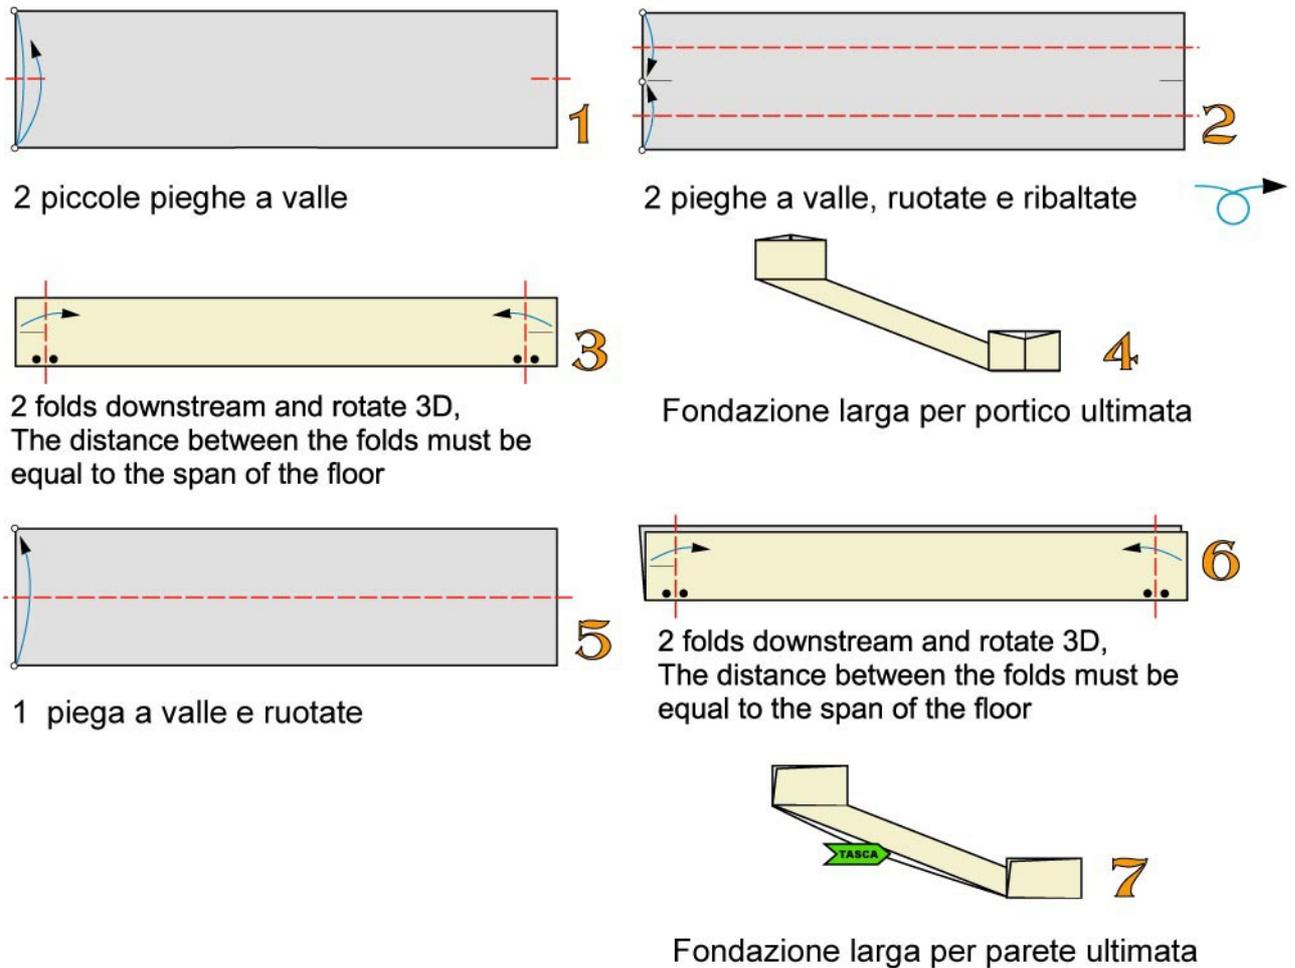

MONTAGGIO DI GIUNTI SULLA FONDAZIONE LARGA

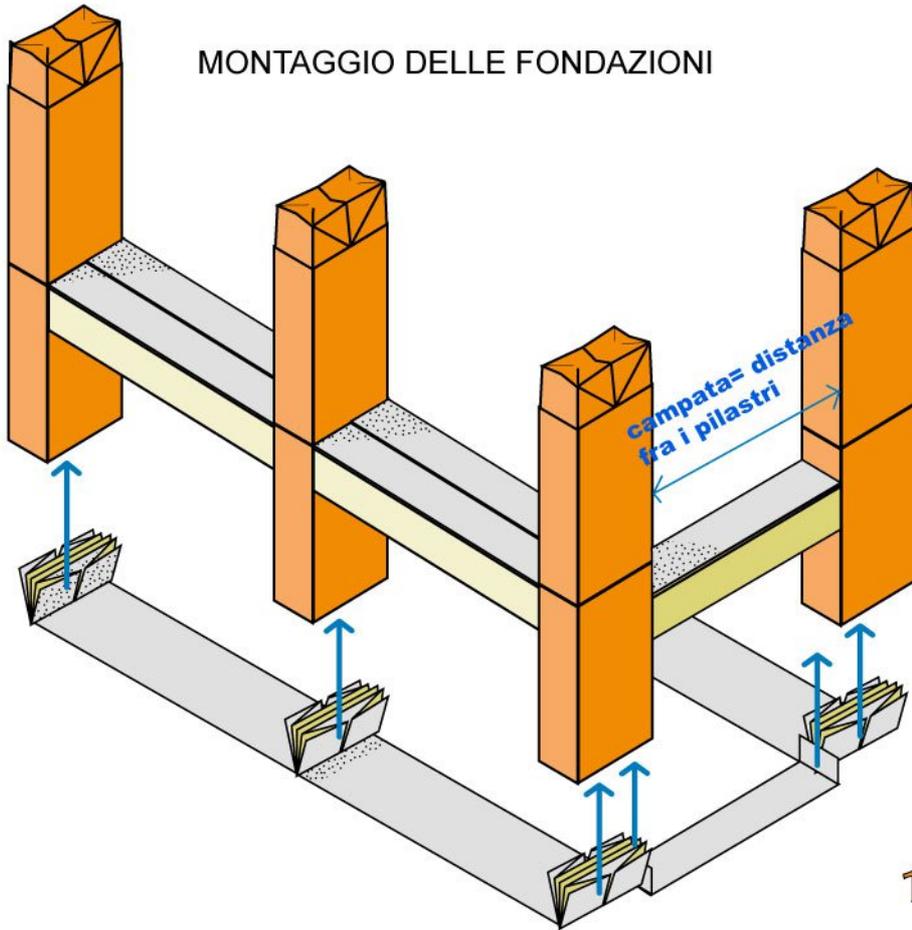

NARROW FOUNDATION BEAM

Also in this case there are 2 possibilities: if there are no walls above, that is to create a porch, the foundation is mounted with the opening downwards, fig. 1,2,3,4.

If, on the other hand, you need to fix the walls, it folds with the side opening, to have a pocket available for the joint, fig. 5,6,7.

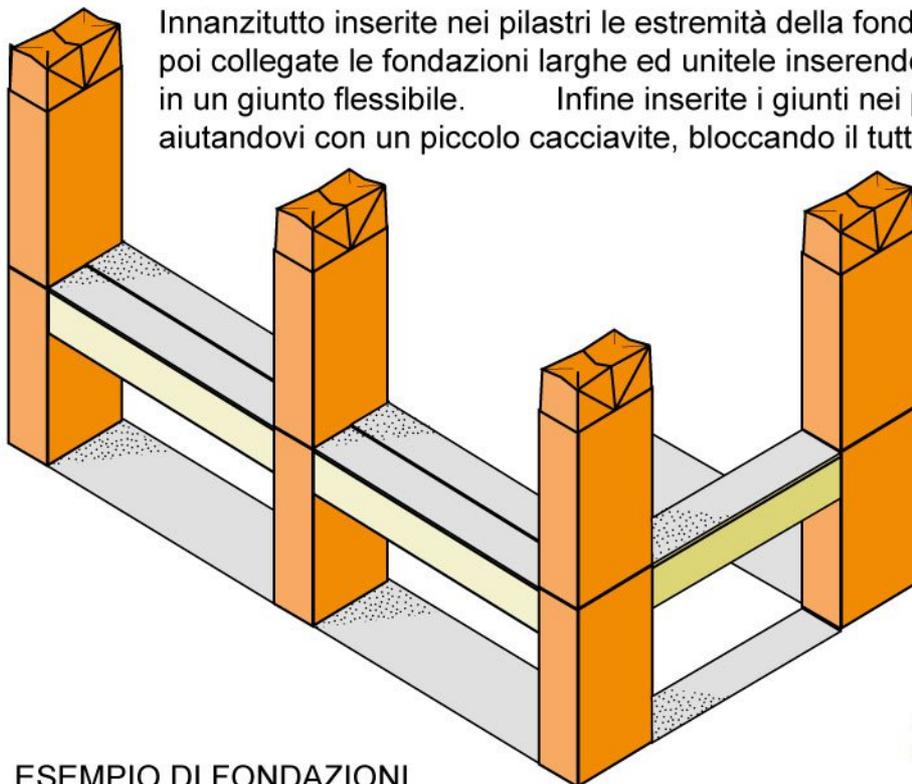

MONTAGGIO DELLE FONDAZIONI

1

Innanzitutto inserite nei pilastri le estremità della fondazione stretta, poi collegate le fondazioni larghe ed unitele inserendone gli estremi in un giunto flessibile. Infine inserite i giunti nei pilastri, magari aiutandovi con un piccolo cacciavite, bloccando il tutto.

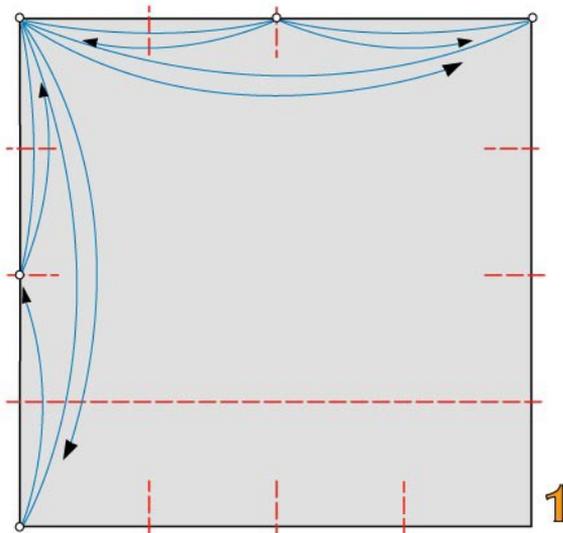

2

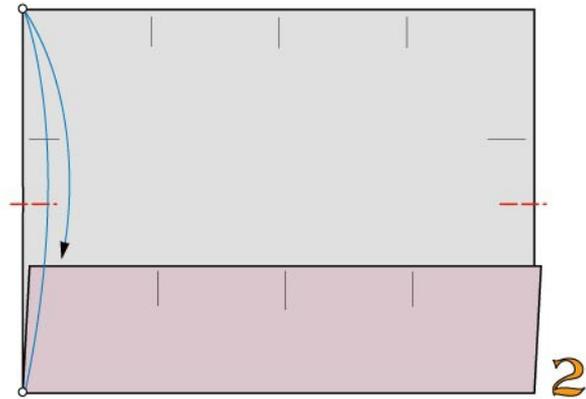

ESEMPIO DI FONDAZIONI COLLEGATE AL TELAIO

WALL WITHOUT WINDOWS - 1

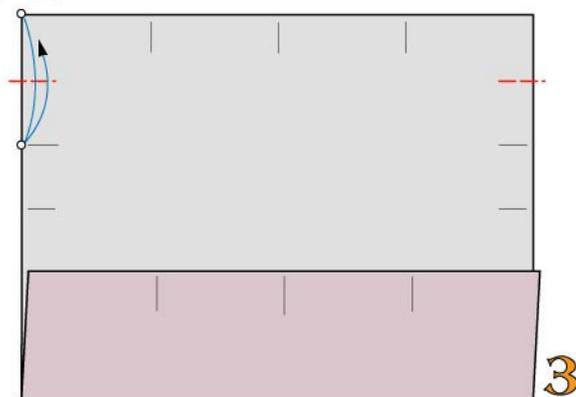

In modern architecture, walls have lost their original load-bearing function and have become simple elements to delimit spaces. A wall without openings may be replaced by a glass wall using a light plastic or acetate sheet. You can also obtain great effects by drawing brick or stone decorations on the sheet before folding.

1 piega a monte e intascate bloccando

1 piega a valle

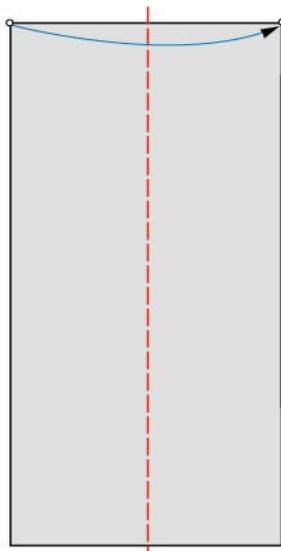

Timpano destro ultimato

ROOF

In origami building, a roof involves overcoming a technical problem that has to do with the coupling of independent components. In this case, I have studied a roof made up of elements of two different widths. Later on, I will study a way to make more complex roofs with roof valleys and ridges.

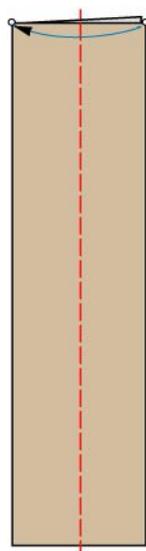

The base module consists of 3 elements: 2 sides made with a half of an ordinary sheet and 1 at the centre which is an unfolded square sheet.

Modulo 8/8

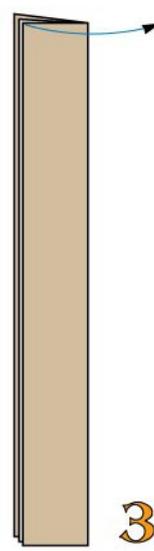

Una piega a valle e ruotate

1

Una piega a valle e ruotate

2

2 pieghe a monte e ruotate

Cappuccio inclinato alto ultimato

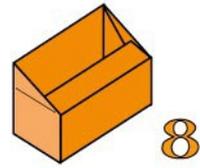

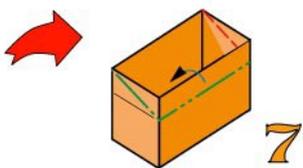

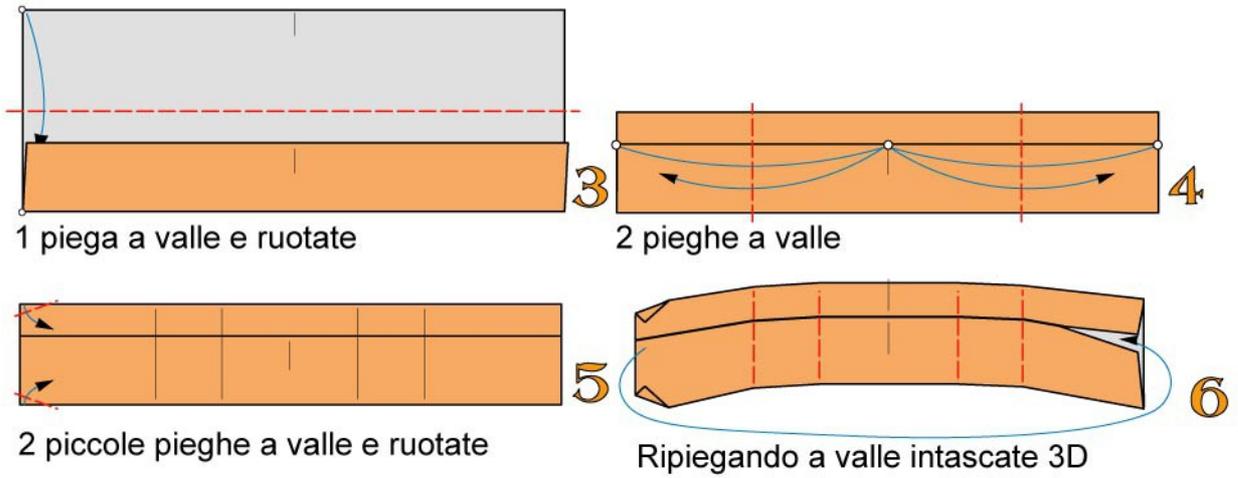

CAPPUCCIO INCLINATO BASSO

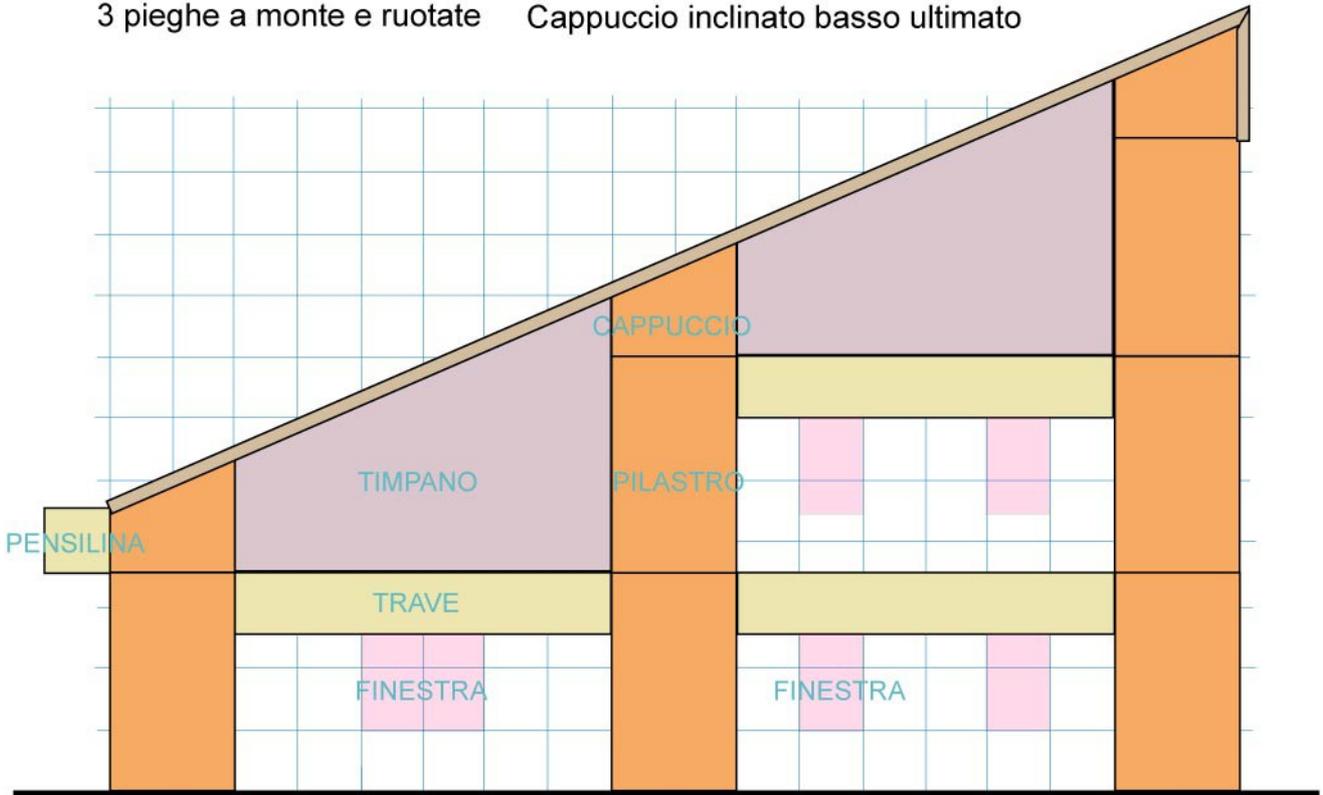

2 piccole pieghe a valle

2 pieghe a valle e ruotate

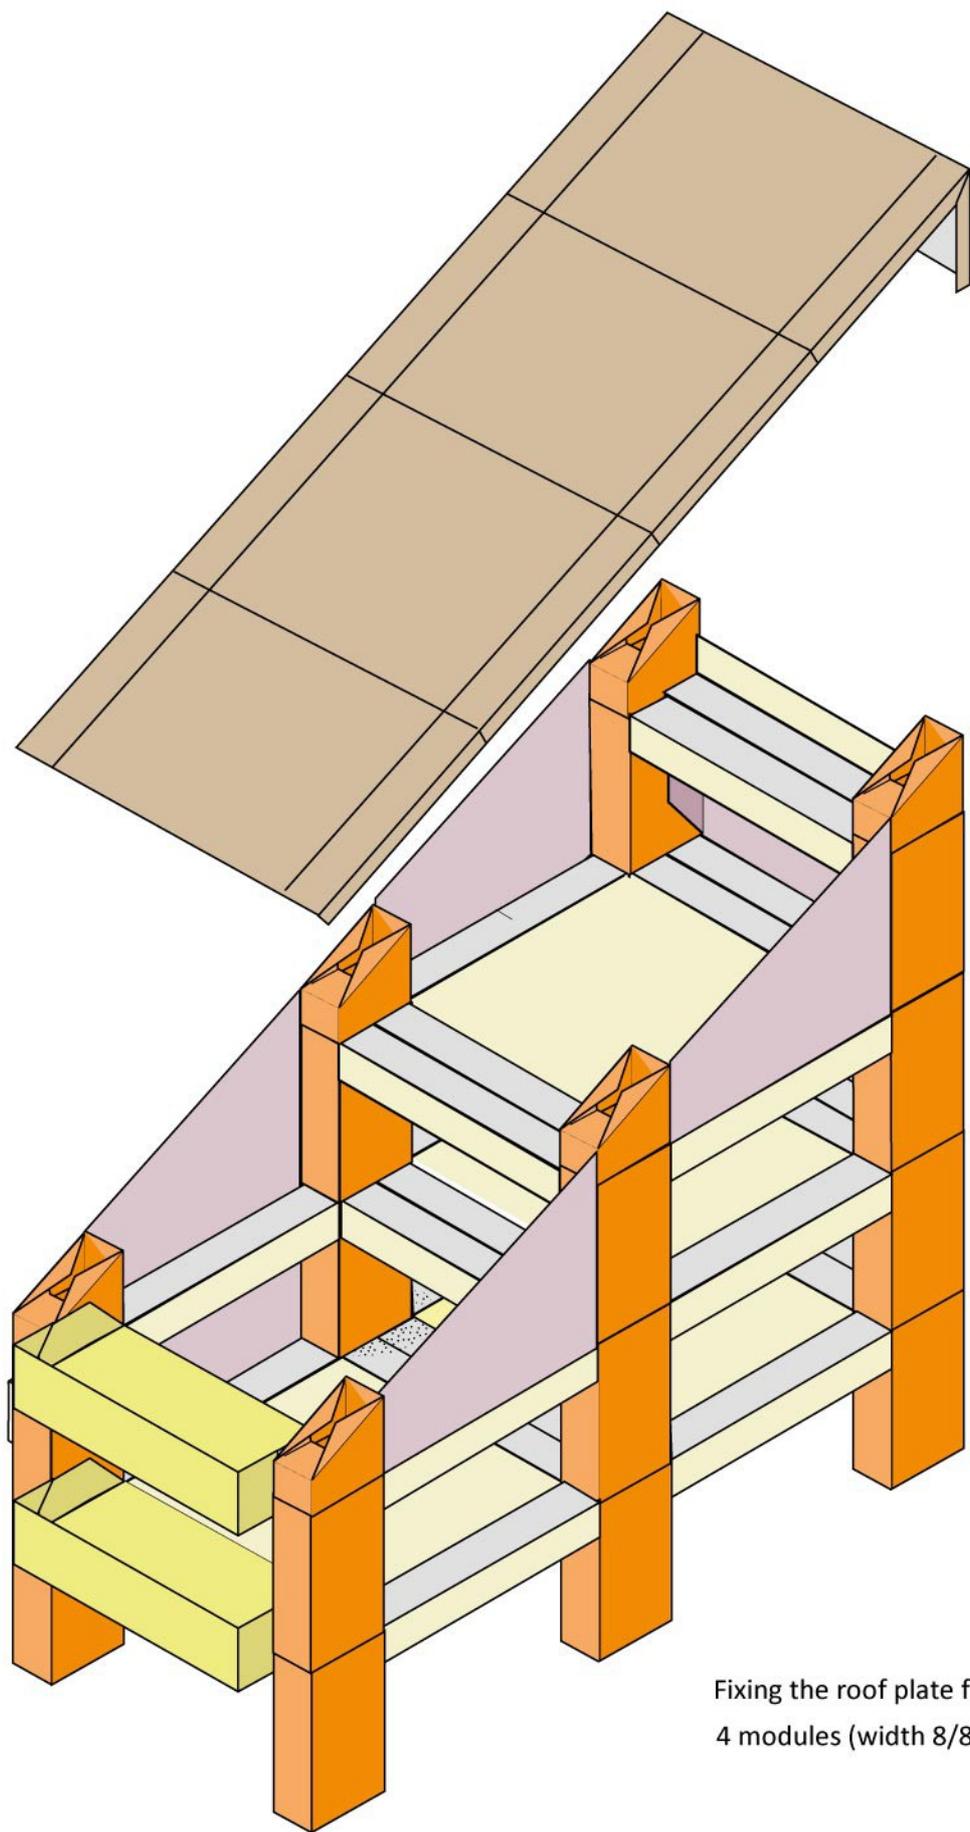

3 pieghe a monte e ruotate Cappuccio inclinato basso ultimato

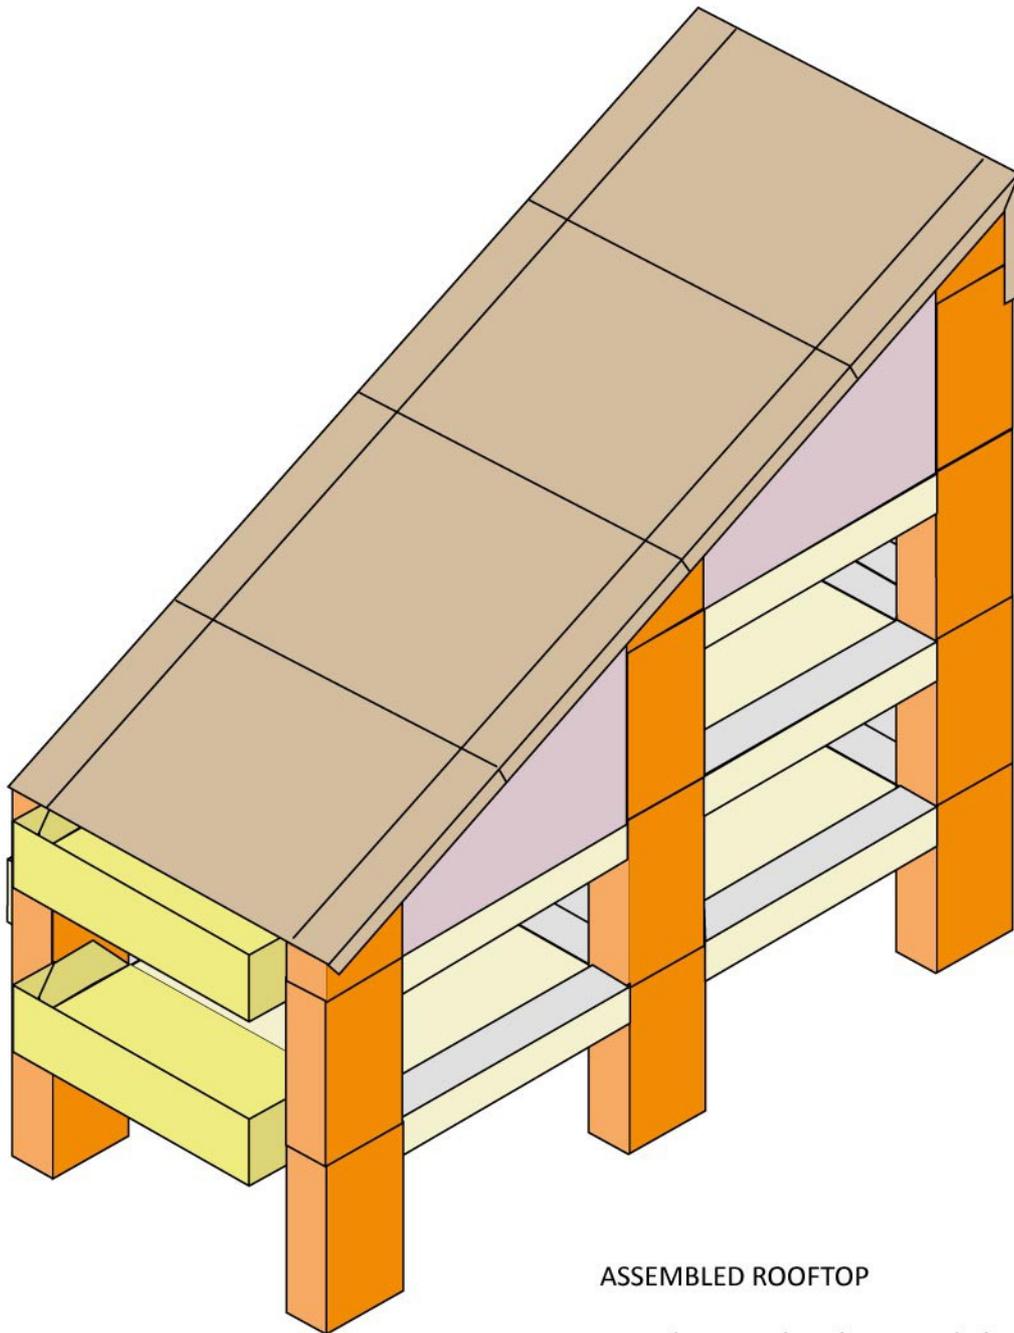

STEEP SLANTING ROOF

Cross section where the length of each square represents 1/8 of the base sheet. The width of the roof is 8/8. There is one wall with a large window and two walls with two narrow windows.

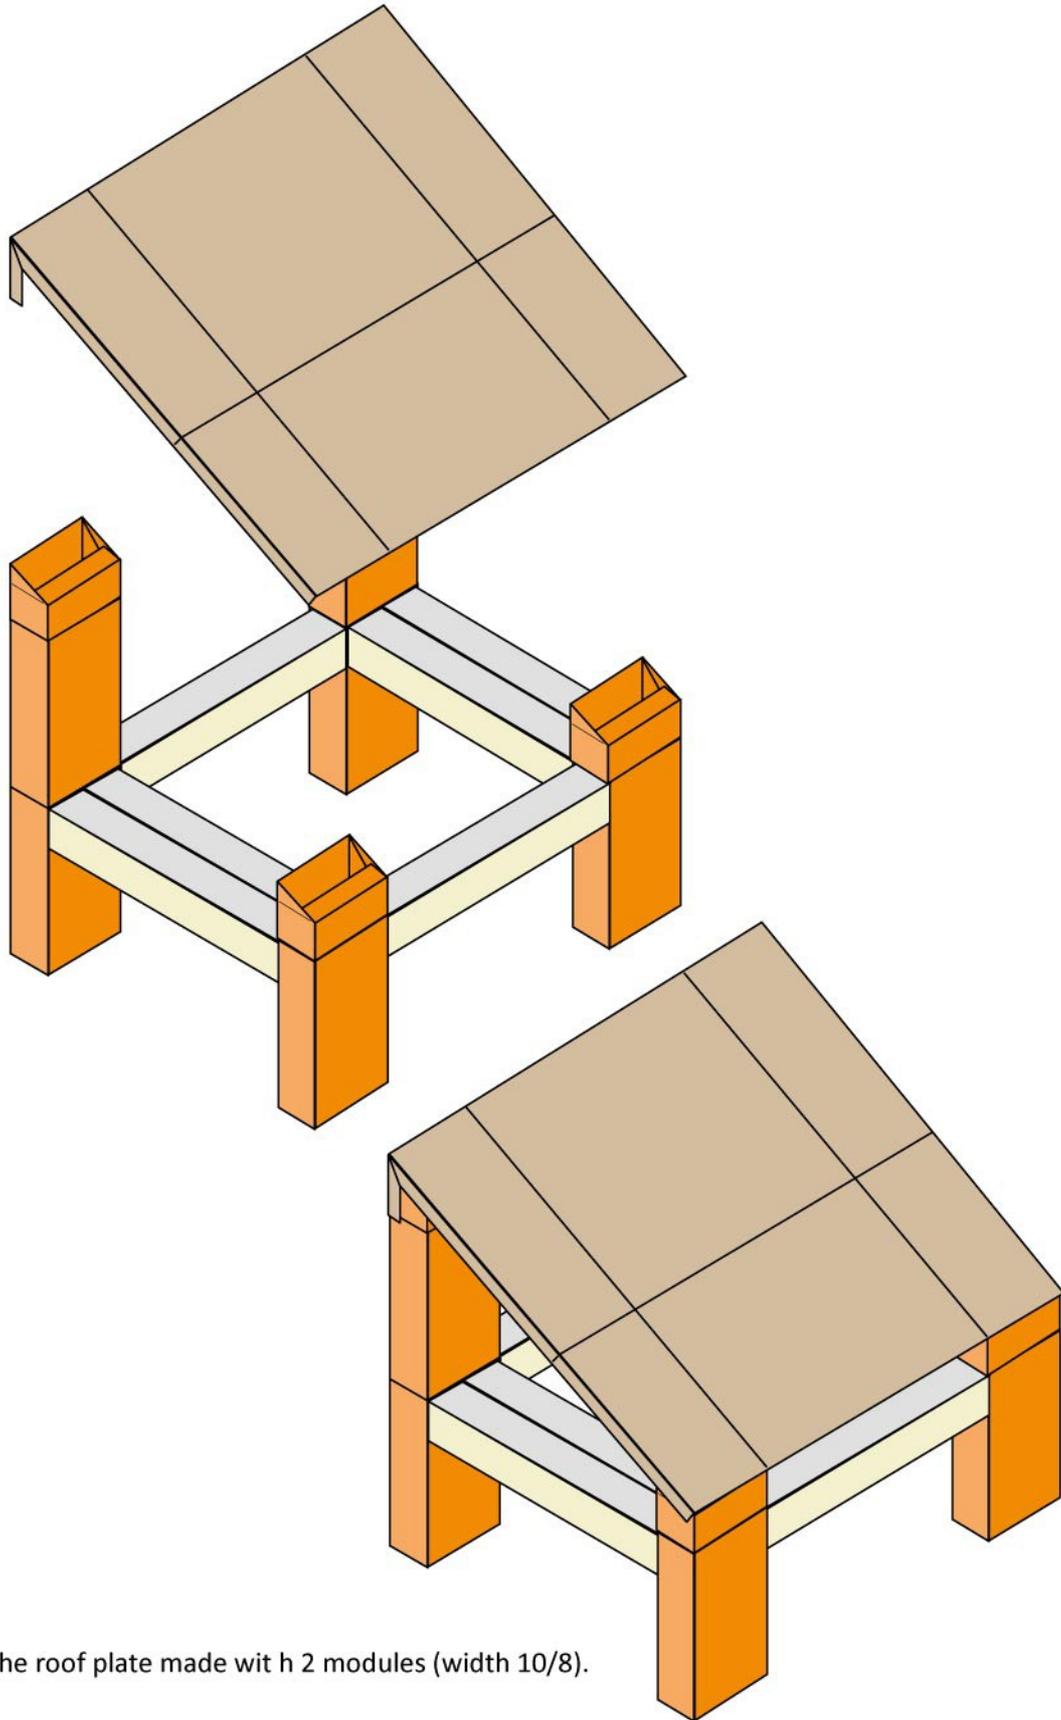

Fixing the roof plate formed by
4 modules (width 8/8)

ASSEMBLED ROOFTOP

It can be seen that the upper balcony is not accessible and has a purely aesthetic function

Fixing the roof plate made with 2 modules (width 10/8).

STAIRWELL

The vertical connection between floors represents the main part of the building, its backbone.

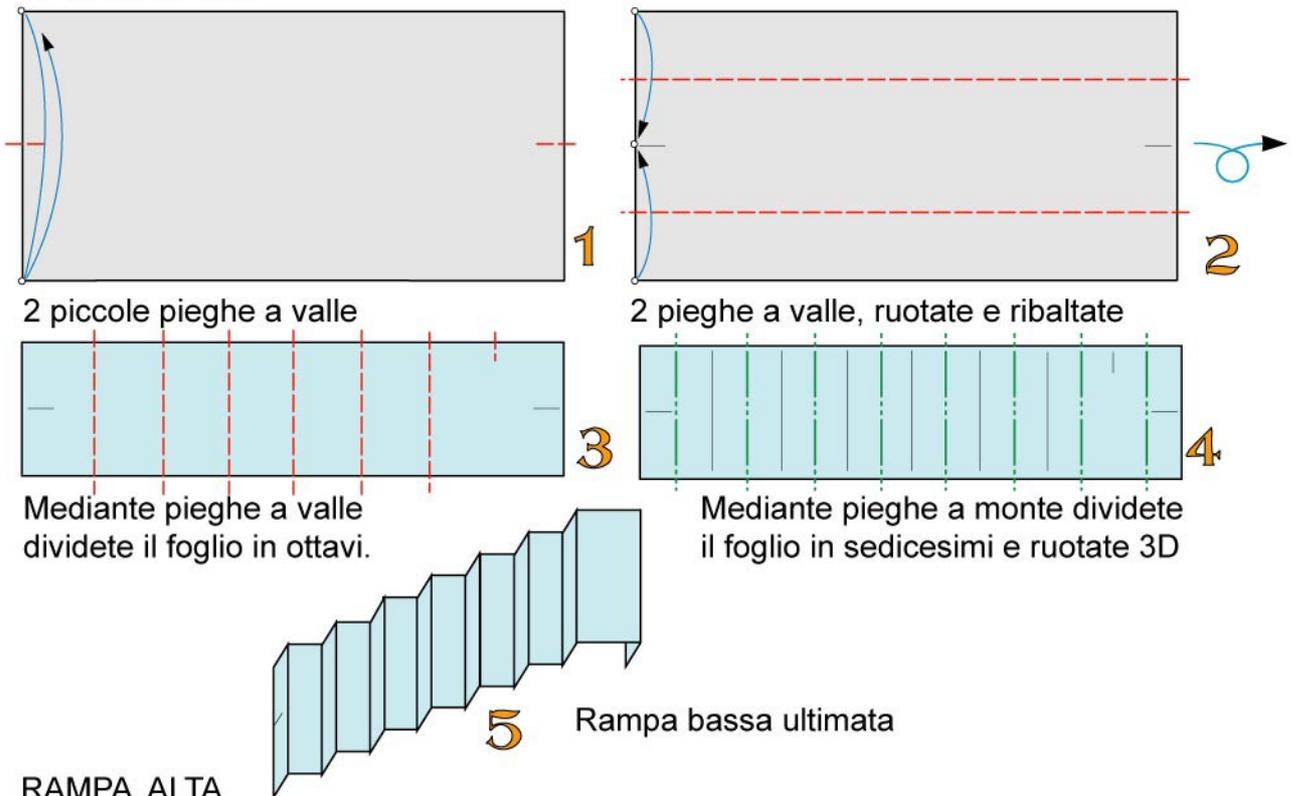

Fixing the flights of stairs can be done in two different ways: either the stairs can be anchored like shelves to the side walls or they can be coupled to the landing beams.

Here we are studying the second solution.

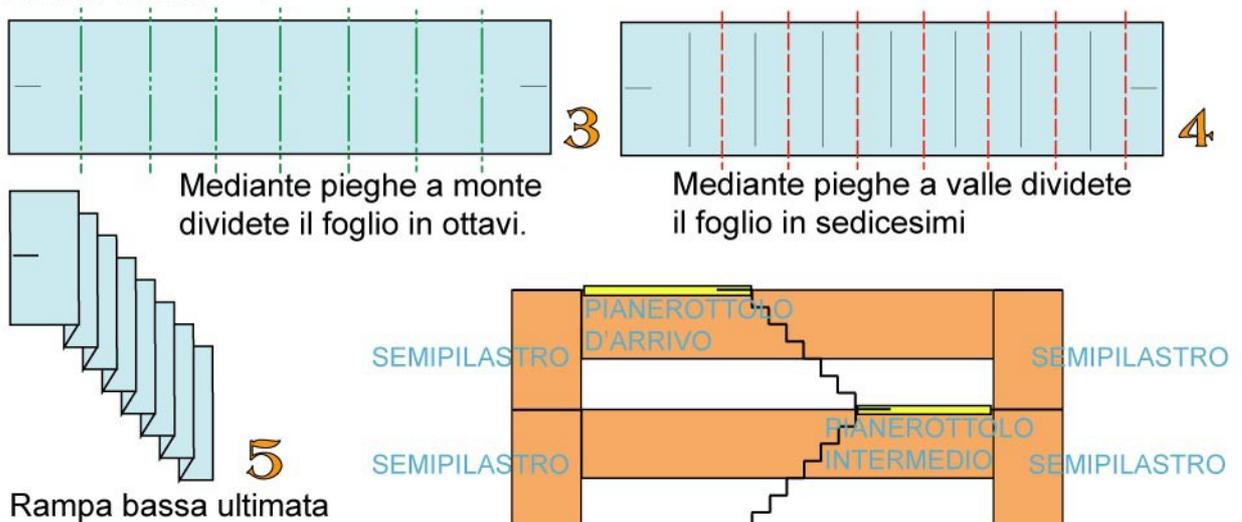

The basic elements required are two different stair flights, two different landings, 8 square section semi-pilasters and 4 reinforced concrete beams.

Cardboard should be used for stairs.
